FORKLIFT

Abstract

Object

Provided is a forklift capable of suppressing misalignment of a reach mechanism while shortening an entire length in a front-back direction.

10

Solving Means

A forklift includes a vehicle including a pair of straddle legs extending forward from a lower part of a vehicle body and provided at an interval in a vehicle width direction, a cargo handling device including a mast provided between the pair of straddle legs and extending in an up-down direction, a lift
15 bracket provided at the mast such that the lift bracket is capable of being raised and lowered, and a pair of forks extending forward from the lift bracket, a reach mechanism including an advance/retract drive unit capable of performing advance/retract drive in a front-back direction on each of the pair of straddle
legs, and a coupling portion coupling the mast and the advance/retract drive
20 unit, in which the coupling portion includes a protrusion provided at one of the advance/retract drive unit and the mast and extending in the up-down direction toward the other of the advance/retract drive unit and the mast, and an accommodating portion provided at the other of the advance/retract drive unit
and the mast and including an accommodating hole into which the protrusion is
25 inserted from the up-down direction with a gap.
