

ABSTRACT

KEY INFORMATION SHARING SYSTEM, DELIVERY DEVICE AND USER
TERMINAL

A key information sharing system includes a delivery device (400) that delivers key information as first information (I1) for a control device (11) equipped in an object (10) and a user terminal (200a) that receives the first information (I1) delivered from the delivery device (400). The delivery device (400) adds second information (I2) that allows the first information (I1) to be transferred between the user terminal (200a) and a third-party terminal (200b) without the delivery device (400), to the first information (I1) to be delivered to the user terminal (200a). The user terminal (200a) transmits the first information (I1) to the third-party terminal (200b) in response to an input operation by a user, when the user terminal (200a) receives the first information (I1) to which the second information (I2) has been added.
