(54) Title: TREATMENT OF OPTIC NEURITIS

(57) Abstract: The present invention provides a method for treating a patient having demyelinating optic neuritis (DON) comprising the sequential or simultaneous administration of a steroid compound and an interferon-beta protein. It is found that early, aggressive treatment of IFN-b is beneficial in such a treatment regimen, for example where the interferon-beta protein is administered at a cumulative weekly dose of more than 12 MIL). The method according to the invention is particularly suitable and beneficial for treatment of patients having early stage DON. In particular, the DON that will benefit from being treated according to the present invention may be in subclinical stage.
