

ABSTRACT

Testing Device and Method for Testing Backplanes and Connectors on Backplanes

A testing device (120) for testing a backplane (101) preferably includes an impulse board (123) with a connector for connection to the backplane (101), where the impulse board (123) sends test signals to the backplane (101); a receiver board (124) with a connector for connection to the backplane (101), where the receiver board (124) receives the test signals; and a communication channel (125,130) between the receiver board (124) and the impulse board (123) through which the receiver board (124) signals to the impulse board (123) results of the test signals.
