

TITLE:
DISPLAY DEVICE

ABSTRACT

5

A display device includes a light source module, a housing, a display panel, a circuit board and a first flexible substrate. The housing includes a base plate, a sidewall and a support part. The base plate is below the light source module. The sidewall forms an accommodation space for the light source module. The support part is connected to the
10 sidewall and extends away from the base plate, wherein the support part has a recess recessed towards the base plate. The display panel is above the light source module and the support part. The circuit board is below the support part, and the support part is located between the display panel and the circuit board. The first flexible substrate connects the light source module to the circuit board through the recess, wherein one side of the recess
15 supports the display panel, and another side supports the circuit board.
