(54) Title: APPARATUS AND METHOD FOR HARVESTING RENEWABLE ENERGY

(57) Abstract: This invention relates to an installation for harvesting renewable energy. The installation includes a first part, a second part and a harvesting means. The first part includes a first harvest point, a weight element and a first connecting element while the second part includes a second harvest point and a second connecting element. The harvesting means is connectable between the first harvest point and the second harvest point. The first connecting element and the second connecting element are freely connectable to each other to allow the first part and the second part to move relative to each other in response to renewable energy impacted on the installation, translating kinetic energy to the harvesting means.
