

MOBILE TERMINAL COMMUNICATION RESTRICTING
DEVICE, METHOD AND PROGRAM

ABSTRACT OF THE DISCLOSURE

Synchronization of a wireless downlink in an existing mobile communication network is established and system notifying information from the existing mobile communication network is received. Synchronization of a wireless uplink in the existing mobile communication network is established and a layer-3 wireless channel establishment requesting message is received. A communication restricting state (ON/OFF state) for each service type (circuit switching service or packet switching service) is confirmed and the communication restricting state (ON/OFF state) is confirmed on the basis of a speed threshold value, based on a result of which confirmation, communication restriction is performed.
