

## **A BLIND PATCH STRUCTURE**

### **ABSTRACT**

A blind patch structure includes a board body, and a receiving part. The  
5 receiving part surrounds the board body. The receiving part has an opening  
interlinked with the receiving part. The airtight sealing strip is installed in  
receiving part of the board body in advance. When the ceiling of the clean  
room is constructed, the blind board is directly assembled with the ceiling  
frame. The assembly for installing the airtight sealing strip at the clean room  
10 can be omitted. It is convenient and rapid for the user to construct the ceiling of  
the clean room.
