SERVICE PROCESSING METHODS AND SYSTEMS BASED ON A CONSORTIUM BLOCKCHAIN NETWORK

ABSTRACT

Disclosed are service processing methods and systems based on a consortium blockchain network. Service nodes in the consortium blockchain network can establish cooperative relationship with each other. For one group of service nodes with cooperative relationship, if any one service node cannot record a service-related transaction due to its shutdown, a client device connected with the service node can send the service-related transaction to another service node in the same group for recordation.
