

ABSTRACT

SYSTEMS AND METHODS FOR GENERATING AND/OR PRESENTING A CONDENSED LIST OF CHANNELS

A method of generating a condensed list of channels for display on a client device of a broadcasting system may include: monitoring channels viewed via a client device configured to receive a plurality of channels; selecting a subset of the plurality of channels based at least in part on a frequency of viewing and/or an amount of time of viewing of the channels; and associating the subset together to generate a condensed list of channels. A related system may include: a client device configured to receive a plurality of channels from a source of programming; and a processor configured to monitor channels viewed via the client device, to select a subset of the plurality of channels based at least in part on a frequency of viewing and/or an amount of time of viewing of the channels, and to associate the subset together to generate a condensed list of channels.
