ABSTRACT

A method for rejecting a paging includes: receiving a paging message sent by a network device in a case of being in a communication state; and sending a rejection response message corresponding to the paging message to the network device based on multi-card capability information and the paging message of the network device, in which, the multi-card capability information is configured to indicate whether the network device supports a multi-card capability. ~~A paging rejection method, apparatus, and device, and a storage medium, which relate to the field of mobile communications. The method comprises: when in a communication state, receiving a paging message sent by a network device; on the basis of multi-card capability information of the network device and the paging message, sending to the network device a response rejection message corresponding to the paging message, the multi-card capability information being used to indicate whether the network device supports a multi-card capability; and determining, on the basis of whether the network device supports the multi-card capability, to reject the paging message sent by the network device. Thus, the situation of whether a network device supports a multi-card capability is fully considered, thereby improving the accuracy of a terminal rejecting a paging message.~~
