CLAIMS

1. An incorrect conversion dictionary generating system implemented by a computer and software, said incorrect conversion dictionary generating system comprising:

a term input unit causing the computer to receive ~~to which a term is~~ an input term (i.e., input written word(s));

a voice ~~data~~ conversion unit ~~that converts~~causing the computer to receive the input term from the term input unit, and convert ~~an~~ the input term to voice ~~data~~ to obtain input-term voice ~~data, the input term being a term input to the term input unit~~;

a voice ~~data~~ analysis unit ~~that receives~~causing the computer to receive the input-term voice ~~data output~~ from the voice ~~data~~ conversion unit, ~~performs~~and perform a voice analysis to convert the input-term voice ~~data~~ to ~~a term, and obtains a~~ voice analyzed term(s) (i.e., voice analyzed written word(s)); and

an incorrectly converted term determining unit ~~that receives~~causing the computer to receive the input term from the term input unit or the voice ~~data~~ conversion unit, receive~~s~~ the voice analyzed term from the voice ~~data~~ analysis unit, and determine~~s~~ the voice analyzed term as an incorrectly converted term of the input term when the input term does not match the voice analyzed term, wherein

the incorrect conversion dictionary generating system ~~receives~~ causing the computer to receive the input term and the incorrectly converted term ~~thereof~~ from the incorrectly converted term determining unit, associates the input term with the incorrectly converted term ~~thereof~~, and store~~s~~ the input term with associated the incorrectly converted term in an incorrect conversion dictionary in the computer.

2. The incorrect conversion dictionary generating system according to claim 1, wherein

the term input unit includes:

an electronic file receiving unit ~~that receives~~causing the computer to receive an electronic file; and

a term extraction unit ~~that extracts~~causing the computer to extract ~~a~~the input term included in the electronic file received by the electronic file receiving unit.

3. A voice recognition system including the incorrect conversion dictionary generated by the incorrect conversion dictionary generating system according to claim 1, the voice recognition system implemented by the computer comprising:

a voice receiving unit ~~that receives~~causing the computer to receive a voice;

a voice analysis unit ~~that performs~~causing the computer to receive the voice, and perform a voice analysis on the received voice ~~received by the voice receiving unit~~ to obtain an analyzed term;

an incorrectly converted term determining unit ~~that determines~~causing the computer to receive the analyzed term from the voice analysis unit, and determine whether the received analyzed term matches any of incorrectly converted terms stored in the incorrect conversion dictionary; and

a corrected-term-candidate extraction unit ~~that obtains~~causing the computer to obtain an input term corresponding to the matching incorrectly converted term as a candidate of a correct term when the incorrectly converted term determining unit determines that the analyzed term matches any of the incorrectly converted terms stored in the incorrect conversion dictionary.
