

ABSTRACT

The present disclosure relates to a cell determination method and a cell determination apparatus. The cell determination method is applicable to a terminal, and the method comprises: receiving slice-related information provided by a non-access layer by means of an access layer; and performing cell selection and/or cell reselection according to the slice-related information. According to the technical solution of the present disclosure, since slice-related information is provided in such a way that a terminal itself provides slice-related information of a non-access layer to an access layer, same is not limited, to a certain extent, to being of a network side, and the terminal determines, according to its own situation and at the non-access layer, slice-related information, then receives, by means of the access layer, the slice-related information provided by the non-access layer, and then performs cell selection and/or cell reselection according to the slice-related information, such that a cell selection and/or cell reselection result can better conform to the situation of the terminal itself.
