

ABSTRACT

A frame rate adjustment method and apparatus, a device, a computer readable storage medium, and a computer program product. The method comprises: when a client in a terminal device supports dynamic frame rate switching, obtaining running data when the client runs in the foreground; determining a running scenario of the client on the basis of the running data; determining a target running frame rate of the client on the basis of the running scenario; and the client outputting an image according to the target running frame rate, and triggering an operating system of the terminal device to adjust the refresh rate of a screen according to the target running frame rate.
