

ABSTRACT

FRAUDULENCE MONITORING SYSTEM OF TABLE GAME AND FRAUDULENCE MONITORING PROGRAM OF TABLE GAME

A detection system of the present disclosure stores positions and the amount of game tokens (9) that a game participant (6) places on a game table (4) based on a measurement result by a bet chip measuring device (19) in the same persons for each game participant (6) or player positions (45) of the game table (4). A management control device (50) compares an actual winning rate and a total return amount with figures obtained by a probability statistic calculation at the time of an end of the number of games to determine whether there is a significant difference therebetween and specifies any one of the game participant (6) or the player position (45), the game table (4), or a room having the game table (4) where the significant difference is occurring.
