IL17 and IFN-gamma inhibition for the treatment of autoimmune inflammation

The IL-17 family of cytokines has been associated with the pathogenesis of autoimmune diseases and is generally blamed for the pathogenic symptoms of autoimmune inflammation. Overexpression of IL-17 is a hallmark for autoimmune diseases like rheumatoid arthritis, systemic lupus erythematomatosus, inflammatory bowel disease, multiple sclerosis, and psoriasis (Yao Z *et. al.*, J. Immunol, 155(12), **1995**, 5483-6. Chang S H, *et.al.*, Cytokine, 46, **2009**, 7-11; Hisakata Yamada et.al., Journal of Inflamm. Res., 3, **2010**, 33-44)).

The IL-17 cytokine family comprises six members, out of which IL-17A and IL-17F are the best characterized. IL-17A and IL-17F exist as homo- as well as as heterodimers (IL-17AA, IL-17AF, IL-17FF). IL-17A and IL-17F are clearly associated with inflammation (Gaffen S H, Cytokine, 43, **2008**, 402-407; Torchinsky M B *et al.*, Cell. Mol. Life Sci., 67, **2010**, 1407-1421).

The secretion of IL-17 is predominantly caused by a specific subtype of T helper cells termed TH-17 cells. IL-23, TGFβ and IL-6 were shown to be important factors leading to conversion of naïve CD4+ T-cells to TH17 cells. It was also reported that TGFβ and IL-6 potently induce in synergy TH17 differentiation. Important transcription factors for the secretion of IL-17 from TH17 cells are RORγt and STAT3 (Ivanov,I *et.al.* Cell 126, **2006**, 1121-1133). IL-17 induces pro-inflammatory cytokines (IL-6, TNF-α and IL-1b) and Chemokines (CXCL1,GCP-2,CXCL8 or IL-8,CINC,MCP-1). It increases the production of nitric oxide prostaglandin E2 and matrix-metalloproteinases. As a consequence of these events neutrophil infiltration, tissue damage and chronic inflammation occurs (PECK A *et.al.*, Clin Immunol., 132(3), **2009**, 295-304).

Before the recognition of the importance of IL-17 in autoimmune inflammation, IFN-gamma derived from TH1 cells was believed to be an important cytokine that drives autoimmune disorders (Takayanagi H *et. al.* Nature, 408, **2000**, 600-605. Huang W. *et. al.* Arthritis Res. Ther., 5, **2002**, R49-R59) The secretion of IFN-gamma is a key feature of the TH1 effector cell lineage and the secretion is regulated by the transcription factors T-bet and STAT4 (Bluestone JA *et. al.* Nat Rev Immunol, 11, **2009**, 811-6). Infiltration of activated T-cells and

elevation of M-CSF, IL-10 and TNF support this notion (Yamanda H *et.al.* Ann. Rheu. Dis., 67, **2008**, 1299-1304; Kotake S *et.al.* Eur. J. Immunol, 35, **2005**, 3353-3363).

Recently, a more complex situation was proposed, where hybrid TH17/TH1 cells induced by IL-23 and IL-6 in concert with IL-1 secrete IL-17 and IFN-gamma. These cells are under the control of the transcription factors RORγt and T-bet, confirming the notion, that these are true hybrids of TH1 and TH17 cells. It was also demonstrated that these double producing cells are the pathogenic species in IBD and EAE (Buonocore S *et.al.* Nature, 464, **2010**, 1371-5; Ghoreshi K. *et. al.* Nature, 467, **2010**, 967-971).

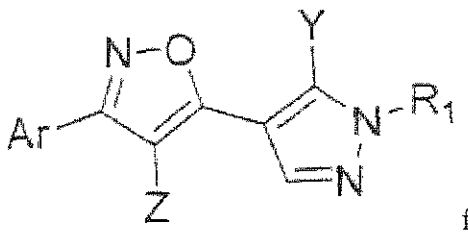

Compounds which target and suppress both IL-17 and IFN-gamma are predisposed for the treatment of autoimmune disorders.

The effectiveness of blocking IL-17 signaling as therapeutic treatment in autoimmune diseases has already been proven in clinical trials with e.g. monoclonal antibodies against IL-17A (AIN457, secukinumab; Ly2439821, ixekizumab; RG4934) and/or the IL-17 receptor IL-17RA (AMG827, brodalumab). Positive results have been reported for the treatment of rheumatoid arthritis, psoriasis and uveitis (Hueber W *et al.*, Sci. Transl. Med., 2, **2010**, 52ra72, DOI: 10.1126/scitranslmed.3001107; van den Berg W B *et al.*, Nat. Rev. Rheumatol., 5, **2009**, 549-553), ankylosing spondylitis and spondyloarthritides (Song I-H *et al.*, Curr. Opin. Rheumatol., 23, **2011**, 346-351). Secukinumab is currently under investigation in clinical trials for psoriatic arthritis, Behcet disease, uveitits, inflammatory bowel disease, Crohn's disease, multiple sclerosis (Kopf M *et al.*, Nat. Rev. Drug Disc., 9, **2010**, 703-718; Song I-H *et al.*, Curr. Opin. Rheumatol., 23, **2011**, 346-351). Brodalumab, Ixekizumab and RG4934 are currently in clinical trials for the treatment of rheumatoid arthritis, psoriasis and/or psoriatic arthritis (Kopf M *et al.*, Nat. Rev. Drug Disc., 9, **2010**, 703-718; clinicaltrials.gov; *Medicines in development for skin diseases*, 2011, published by PhRMA, www.phrma.com).

With regard to blocking of IFN-gamma signaling as therapeutic treatment in autoimmune diseases, the IFN-gamma-specific monoclonal antibody AMG811 is currently under clinical investigations for the treatment of systemic lupus erythematosus (Kopf M *et al.*, Nat. Rev. Drug Disc., 9, **2010**, 703-718).

The packaging material, label and package insert otherwise parallel or resemble what is generally regarded as standard packaging material, labels and package inserts for pharmaceuticals having related utilities.

The pharmaceutical compositions according to this invention are prepared by processes which are known per se and familiar to the person skilled in the art. As pharmaceutical compositions, the compounds of the invention (= active compounds) are either employed as such, or preferably in combination with suitable pharmaceutical auxiliaries and/or excipients, e.g. in the form of tablets, coated tablets, capsules, caplets, suppositories, patches (e.g. as TTS), emulsions, suspensions, gels or solutions, the active compound content advantageously being between 0.1 and 95% and where, by the appropriate choice of the auxiliaries and/or

excipients, a pharmaceutical administration form (e.g. a delayed release form or an enteric form) exactly suited to the active compound and/or to the desired onset of action can be achieved.

The person skilled in the art is familiar with auxiliaries, vehicles, excipients, diluents, carriers or adjuvants which are suitable for the desired pharmaceutical formulations, preparations or compositions on account of his/her expert knowledge. In addition to solvents, gel formers, ointment bases and other active compound excipients, for example antioxidants, dispersants, emulsifiers, preservatives, solubilizers, colorants, complexing agents or permeation promoters, can be used.

As used herein, additional therapeutic agents that are normally administered to treat or prevent a particular disease are known as appropriate for the disease being treated.

In a further aspect of the present invention, the compounds according to this invention or the salts of said compounds of formula (I), may be combined with standard therapeutic agents which are commonly used for the treatment of the medical conditions as described herein.

The person skilled in the art is aware on the base of his/her expert knowledge of the total daily dosage(s) and administration form(s) of the additional therapeutic agent(s) coadministered. Said total daily dosage(s) can vary within a wide range. In practicing the present invention and depending on the details, characteristics or purposes of their uses mentioned above, the compounds according to the present invention may be administered in combination therapy separately, sequentially, simultaneously or chronologically staggered (e.g. as combined unit dosage forms, as separate unit dosage forms or a adjacent discrete unit dosage forms, as fixed or nonfixed combinations, as kit-of-parts or as admixtures) with one or more standard therapeutics, in particular art-known chemotherapeutic or target specific anti-cancer agents, such as those mentioned above.

Thus, a further aspect of the present invention is a combination or pharmaceutical composition comprising a first active ingredient, which is a compound according to this

invention or a salt thereof, a second active ingredient, which is an art-known standard therapeutic for the medical conditions as described herein, and optionally a pharmacologically acceptable carrier, diluent and/or excipient for sequential, separate, simultaneous or chronologically staggered use in therapy in any order, e.g. to treat, prevent or ameliorate in a patient the medical conditions as described herein.

In this context, the present invention further relates to a combination comprising a first active ingredient, which is at least one compound according to this invention, and a second active ingredient, which is at least one art-known standard therapeutic for the medical conditions as described herein, for separate, sequential, simultaneous or chronologically staggered use in therapy, such as e.g. in therapy of those diseases mentioned herein.

The term "combination" according to this invention may be present as a fixed combination, a non-fixed combination or a kit-of-parts. A "fixed combination" is defined as a combination wherein the said first active ingredient and the said second active ingredient are present together in one unit dosage or in a single entity. One example of a "fixed combination" is a pharmaceutical composition wherein the said first active ingredient and the said second active ingredient are present in admixture for simultaneous administration, such as in a formulation. Another example of a "fixed combination" is a pharmaceutical combination wherein the said first active ingredient and the said second active ingredient are present in one unit without being in admixture.

A "kit-of-parts" is defined as a combination wherein the said first active ingredient and the said second active ingredient are present in more than one unit. One example of a "kit-of-parts" is a combination wherein the said first active ingredient and the said second active ingredient are present separately. The components of the kit-of-parts may be administered separately, sequentially, simultaneously or chronologically staggered.

The first and second active ingredient of a combination or kit-of-parts according to this invention may be provided as separate formulations (i.e. independently of one another), which are subsequently brought together for simultaneous, sequential, separate or chronologically staggered use in combination therapy; or packaged and presented together as separate components of a combination pack for simultaneous, sequential, separate or chronologically staggered use in combination therapy.

The type of pharmaceutical formulation of the first and second active ingredient of a combination or kit-ofparts according to this invention can be similar, i.e. both ingredients are formulated in separate tablets or capsules, or can be different, i.e. suited for different administration forms, such as e.g. one active ingredient is formulated as tablet or capsule and the other is formulated for e.g. intravenous administration.

The amounts of the first and second active ingredients of the combinations, compositions or kits according to this invention may together comprise a therapeutically effective amount for the treatment, prophylaxis or amelioration of a medical condition as described herein

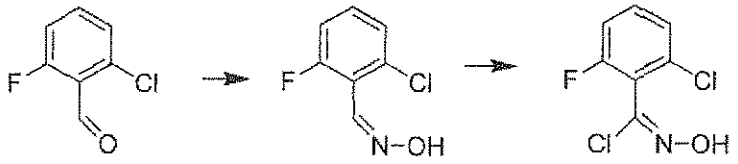

A further aspect of the present invention is a method for treating cotherapeutically the medical conditions as described herein, in a patient in need of such treatment comprising administering separately, sequentially, simultaneously, fixed or non-fixed a pharmacologically active and therapeutically effective and tolerable amount of one or more of the compounds according to the present invention and a pharmacologically active and therapeutically effective and tolerable amount of one or more art-known therapeutic agents for the medical conditions as described herein, to said patient.

For the production of the pharmaceutical compositions, the compounds of the invention (= active compounds) are preferably mixed with suitable pharmaceutical auxiliaries and further processed to give suitable pharmaceutical formulations. Suitable pharmaceutical formulations are, for example, powders, emulsions, suspensions, sprays, oils, ointments, fatty ointments, creams, pastes, gels or solutions. The pharmaceutical compositions according to the invention are prepared by processes known per se.

The dosage of the active compounds is carried out in the customary order of magnitude. Topical application forms (such as ointments) thus contain the active compounds in a concentration of, for example, 0.1-99%. The customary dose in the case of systemic therapy (p.o.) is usually between 0.3 and 30 mg/kg per day, (i. v.) is usually between 0.3 and 30 mg/kg/h. The choice of the optimal dosage regime and duration of medication, particularly the optimal dose and manner of administration of the active compounds necessary in each case can be determined by a person skilled in the art on the basis of his/her expert knowledge.

A method for synthesis of the compounds of the formula (I) comprises the step of reacting a nitriloxyde with an acetoacetate, haloalkene or methylcrotonate to obtain a methyl-isooxazole derivative (Hanson JC *et.al.* J Chem Soc **1965**, 5976-5979, Lasri J *et. al.* J Heterocyclic Chem, 45,2008, 1385-1389). Nitriloxydes are obtained from aldehydes by the reaction of hydroxylamine (II) to obtain oximes (Cheng FK *et. al.* Bioorg Med Chem Lett **2006**, 16, 3376. Oximes are reacting with n-Chlorsuccinimide to obtain the corresponding chlorooxime (III) (Balachandran S *et. al.* Bioorg Med Chen Lett. 19, 2009, 4773-4776).

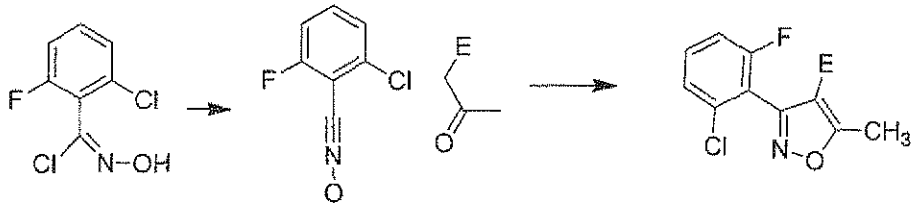

Scheme (1)

I **II** **III**

The chlorooxime (III) is used in situ to form the nitriloxyde (IV) and a cycloaddition to the appropriate dipolarophile yields the appropriate 3-phenyl-5-methylisoxazole (VI).

Scheme (2)

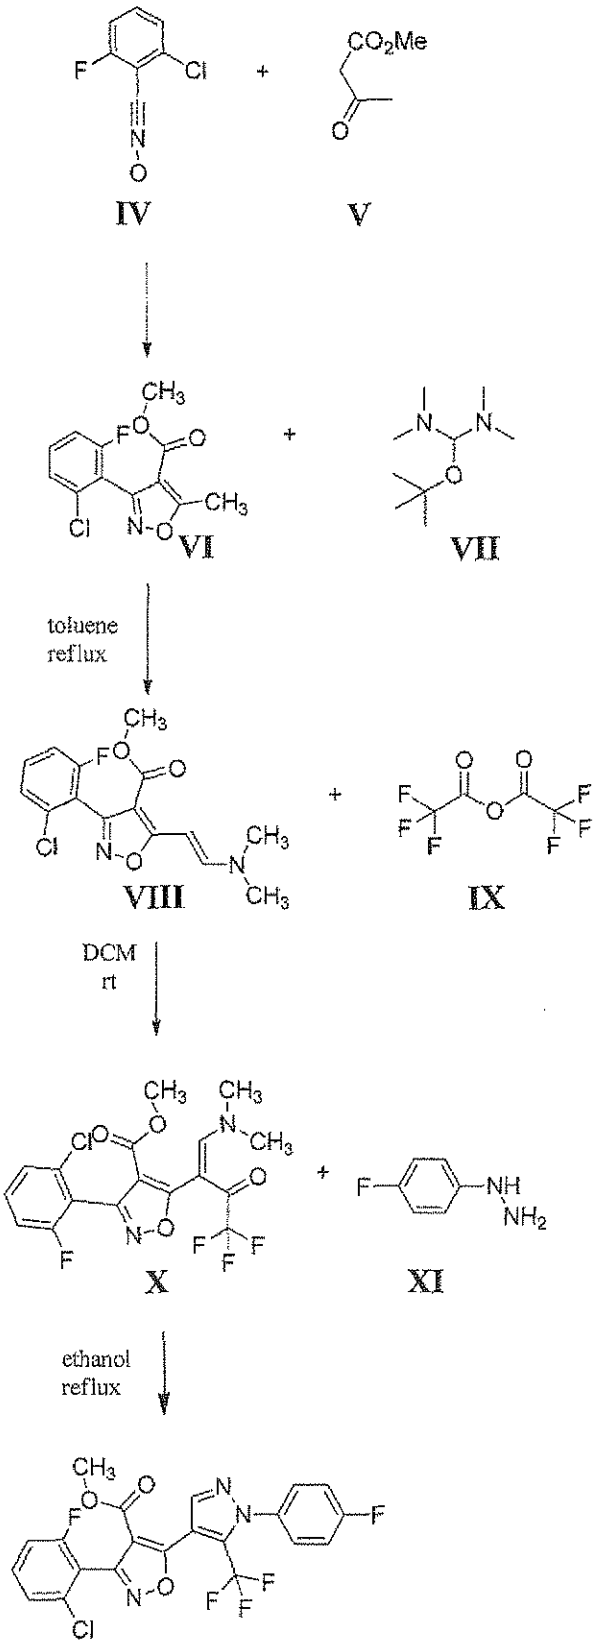

III **IV** **V** **VI**

The isooxazole product (VI) can be converted with Bredereck's reagent (VII) in refluxing toluene to the appropriate enamine (VIII) (Bredereck H *et. al.* Chem Ber 101, **1968**, 41-50). This enamine compound (VIII) is treated with an acid anhydride or an appropriate activated acid (IX) to the key intermediate phenyl-dimethylamino-trifluoro-oxobuteneyl-isoxazol (X). This intermediate is heated with a substituted hydrazine (XI) to obtain the pyrazol as final product (here Compound 3).

This method leads to the 4-phenyl-5-trifluoromethyl-1H-pyrazolyl isomer, this is as described in Scheme (3) the pyrazol with the phenyl group adjacent to the trifluoromethyl group.

To a solution of (E)-2-chloro-6-fluorobenzaldehyde oxime (2 g) in 10 mL Dimethylformamide (DMF) at room temperature 0.23 g N-Chlorosuccinimide (NCS) were added. Dry hydrogen chloride was bubbled into the DMF solution until the reaction temperature rise up to 35°C. Then 1.21 g N-chloro-succinimide were added in portions, the temperature was kept at 35 - 45°C. Analysis of proliferation of and Cytokine production by human PBMC stimulated with PHA

Peripheral blood mononuclear cells (PBMC) from healthy human donors were purified using Accuspin™ System-Histopaque-1077 (Sigma) according to the protocol recommended by the manufacturer. Purified PBMC were then washed twice with phosphate-buffered saline (PBS) and resuspended in RPMI1640 culture medium supplemented with 10% dialyzed heat inactivated fetal calf serum, 1.5 mM L-glutamine, 100 U penicillin/ml, and 100 mg streptomycin/ml (all from PAN Biotech, Aidenbach, Germany). For stimulation, PBMC were

seeded at 1 x 10^5 cells/well, activated with 2 µg/ml phytohaemagglutinin (PHA, Sigma) and incubated with the test compounds for 48 hours. IL-17A, IL-17F and INF-γ were then determined in the culture supernatant using a Luminex BioPlex system, following the manufacturer's instructions (BioRad, Munich, Germany). For screening, compounds were used at 10, 1, 0.1 and 0.01 µM. To determine the IC_{50}, compounds were titrated semilogarithmically.

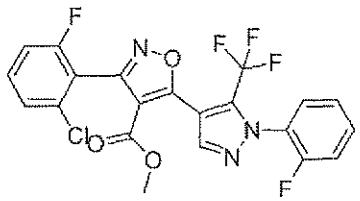

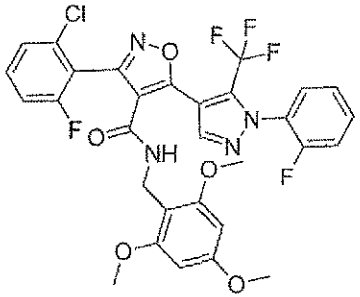

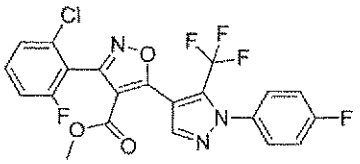

Cell proliferation was analysed using the BrdU based cell proliferation ELISA from Roche (Mannheim, Germany) according to the manufacturer's instructions.

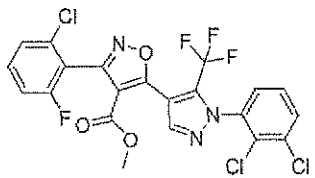

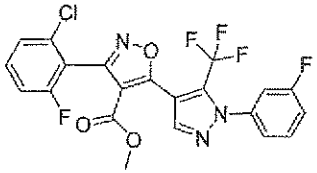

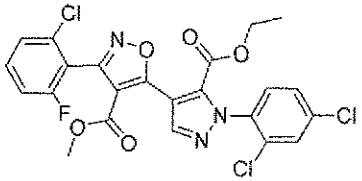

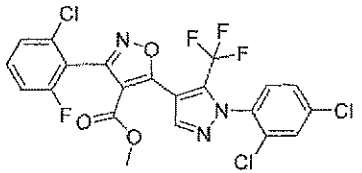

Cytokines were determined in the aforementioned culture supernatant using the following methods: IL-17AA/AF was measured using the Luminex BioPlex system (BioRad, Munich, Germany); IL-17AA using the human homodimer IL-17A ELISA Ready Set Go Kit from eBioscience (Frankfurt, Germany); IL-17FF using the human IL-17F ELI-Pair from Hölzel DiagnosticaGmBH (Köln, Germany); and IFN-γ using the OptEIA human IFN-g ELISA from BD Bioscience (Heidelberg, Germany), all following the manufacturer's instructions.

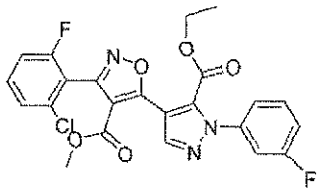

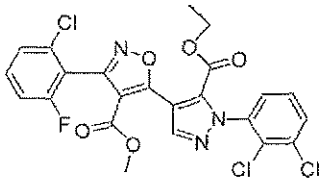

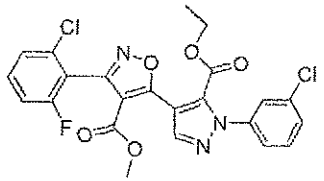

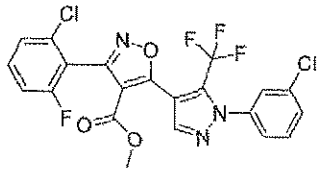

T cell proliferation assay

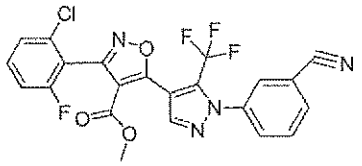

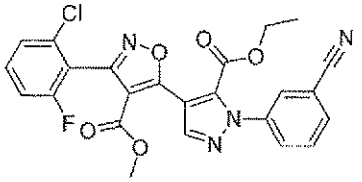

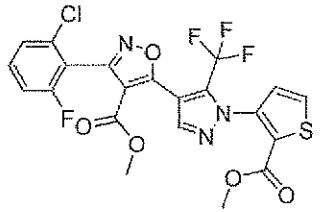

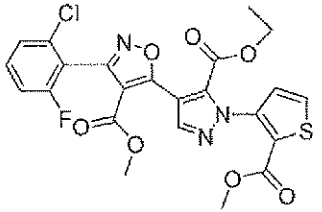

Peripheral blood mononuclear cells (PBMC) from healthy human donors were isolated by centrifugation over Ficoll-Hypaque (Sigma-Aldrich, Germany) according to manufacturer's instructions. Purified PBMC were washed twice with PBS and resuspended in RPMI1640 culture medium supplemented with 10% dialyzed heat inactivated fetal calf serum, 1.5 mM L-glutamine, 100 U penicillin/ml, and 100 mg streptomycin/ml (all from PAN Biotech, Aidenbach, Germany). For stimulation, PBMC were seeded at 1 x 105 cells/well, activated with 2 µg/ml phytohaemagglutinin (PHA, Sigma) and incubated with the test compound. After 48 hours proliferation was measured using the BrdU based cell proliferation ELISA from Roche (Mannheim, Germany) according to the manual.
