

ABSTRACT OF THE DISCLOSURE

LAMINATED SPRING STRUCTURE AND FLEXIBLE CIRCUITRY
CONNECTOR INCORPORATING SAME

5 A flexible circuitry connector includes an improved
contact spring assembly that is compared with a plurality
of discrete spring elements arranged longitudinally along
the connector. Flexible circuitry is supported by the
spring elements and held against a circuit card by each
10 such spring element in a manner such that the spring
elements apply a series of discrete contact forces for
the length of the spring assembly, thereby eliminating
any problems due to circuit card thickness variations and
warpage as well as other compliance issues..
