

ABSTRACT

A bottle 1 for a dispenser is made of a resin material and comprises: a rectangular bottom 10; a square tubular body section 20 that continues upward from the edge of the bottom 10; a shoulder section 30 that is inclined upward from the upper edge of the body section 20 towards a center section 31; and a neck section 40 that protrudes upward from the center section 31. The body section 20 has bellows 52 that can expand or contract in the vertical direction. The thickness t11 of each of four corner sections 52a of the bellows 52, when viewed in plan view, is less than the thickness t12 of each of four connecting sections 52b that connect the corner sections 52a of a bellows section 50 together.
