

## Description

This invention relates generally to a foot-operated press, and more particularly to a foot-operated press for applying fastener elements such as buttons to garment articles.

There have been proposed many different forms of apparatus designed to apply fastener elements such as buttons, rivets, eyelets, ornaments and the like to substrates such as garment fabrics or other sheet materials. A typical example of such apparatus (see for example patent document DE-A-2632941) is a press having a punch-and-die assembly and a lever mechanism driven by a foot pedal for actuating a ram which carries a punch, the foot pedal being pressed to provide a downward stroke of the ram thereby driving one of the fastener elements into the other fastener element underlying the substrate on the die. This type of apparatus known in the art is designed such that the foot pedal returns to its initial position immediately upon releasing the operator's foot from the pedal, and consequently the punch ascends regardless of whether or not the two fastener elements have been joined properly together on the substrate. Therefore, it would often happen that a given cycle of attaching the buttons or the like goes unnoticed or unchecked as to completion of the full clinching of the two mating fastener elements.

The present invention seeks to provide an improved foot-operated press incorporating structural features which ensure full and complete clinching of fastener elements onto a substrate.

The present invention further seeks to provide means in the foot-operated press for preventing the punch from ascending or returning to its start position until after the fastener elements have been fully clinched in place.

According to the present invention, there is provided a foot-operated press comprising: a punch vertically reciprocally supported on a frame; and a foot pedal pivotably supported on said frame and angularly movable between an uppermost standby position and a lowermost clinching position to reciprocate said punch, said foot pedal being normally urged toward said standby position, characterized by a ratchet mechanism mounted on a shaft fixedly supported on said frame for operatively interconnecting said foot pedal and said punch, said ratchet mechanism including a housing secured to said shaft, a ratchet wheel rotatably mounted on said shaft and connected to said foot pedal for movement in unison with said foot pedal, said ratchet wheel having a series of external ratchet teeth disposed in said housing and a pin extending parallel to the axis of said shaft, a pawl pivotably mounted on said housing and normally urged

toward said ratchet wheel, said pawl being lockingly engageable with said ratchet teeth to prevent backward movement of said ratchet wheel and hence said foot pedal connected thereto, and a cam disc rotatably disposed in said housing and having a recessed portion loosely receiving said pin and engageable with said pin to turn said cam disc together with said ratchet wheel, and further having a cam surface engageable with said pawl to urge the latter away from said ratchet teeth.

Many other advantages and features of the present invention will become manifest to those versed in the art upon making reference to the detailed description and the accompanying sheets of drawings in which a preferred structural embodiment incorporating the principles of the present invention is shown by way of illustrative example. In the drawings, like reference characters refer to like or corresponding parts throughout the several views.

Figure 1 is a side elevational view, partly in cross section, of a foot-operated press embodying the present invention;

Figure 2 is an enlarged front elevational view, partly in cross section, of a ratchet mechanism of the press shown in Figure 1;

Figure 3 is a cross-sectional view taken along line III-III of Figure 2; and

Figures 4 through 8 inclusive are views similar to Figure 3, illustrative of the sequence of operation of the ratchet mechanism.

Figure 1 shows the general construction of a foot-operated press 10 embodying the present invention. The press 10 generally comprises a frame 11, a foot pedal 12 operatively connected via a ratchet mechanism 13 to a connecting rod 14 which is in turn pivotably connected to one end of a pivot lever 15a pivoted at its midpoint to the frame 11. The other end of the pivot lever 15a is pivotably connected to one end, the righthand end as seen in Figure 1, of an actuating lever 15b. A toggle joint 16 is formed by the lever 15b and two further levers 16a and 16b. The upper end of lever 16a is pivoted to the frame 11. The lower end of lever 16b is pivoted to a vertically slidably guided ram 17. There is a common pivotal connection between the lower end of lever 16a, the upper end of lever 16b and the lefthand end, as seen in Figure 1, of lever 15b, that is, the opposite end of lever 15b to that pivoted to lever 15a. The ram 17 carries a punch 18 which is cooperative with a die 19 for assembling a pair of fastener elements (not shown) in clinched condition, with a substrate such as a garment fabric (not shown) disposed between the two fastener elements. The foot pedal 12 is urged clockwise as seen in Figure 1 about the ratchet mechanism 13 toward its uppermost standby position by means of a tension spring 20

acting between the frame 11 and the foot pedal 12.

The ratchet mechanism 13, as shown in Figures 2 and 3, is mounted on a horizontal shaft 21 fixedly secured to the frame 11 and includes a generally cup-shaped housing 22 secured by a screw 23 to the shaft 21, a ratchet wheel 24 rotatably mounted on the shaft 21 and received in the housing 22, and a cam disc 25 disposed between the ratchet wheel 24 and the closed end of the cup-shaped housing 22 and rotatably fitted around a central hub 22a of the housing 22 disposed inside the housing 22. The ratchet wheel 24 includes an integral tubular axial extension 24a projecting outwardly from the cup-shaped housing 22 and attached by a screw (not designated) to the foot pedal 12 for angular movement around the shaft 21 through a predetermined angular distance together with the foot pedal 12. The ratchet wheel 24 has a series of external teeth 26 on a limited peripheral area disposed in a cutaway peripheral portion 27 defined by a pair of confronting flanges 28 of the housing 22. The ratchet teeth 26 are lockingly engageable with a pawl 29 pivotally connected by a horizontal pin 30 extending between the flanges 28 of the housing 22. The pawl 29 is normally urged toward the ratchet teeth 26 by a leaf spring 31 secured at one end by a screw 32 to the housing 22 between the flanges 28 as shown in Figure 2. The leaf spring 31 has a width slightly smaller than the distance between the flanges 28 so that the pawl 29 is substantially concealed by the leaf spring 31. The force of the spring 31 is smaller than the force of the spring 20, but by the shape of the ratchet teeth 26 and the pawl 29, upon locking engagement of the pawl 29 with the ratchet teeth 26, the ratchet wheel 24 is automatically prevented from turning in the clockwise direction regardless of the forces of the springs 20, 31.

The length of toothed area of the ratchet wheel 24 is defined between a standby position in which the pawl 29 is disengaged from ratchet teeth 26 and located near the first tooth prior to stepping on the foot pedal 12, and a clinching position in which the pawl 29 is released from the ratchet teeth 26 and disposed adjacent to the last tooth upon completion of clinching by full depression of the foot pedal 12.

The length of the toothed area 26 may be extended to a certain extent in the clockwise direction in Figure 3. And it is even possible to provide the ratchet teeth 26 around the entire periphery of the ratchet wheel 24, in which instance a shock noise and vibration would be generated when the pawl 29 is brought into locking engagement with the ratchet teeth 26 upon arrival of the foot pedal 12 at its uppermost standby position. It is therefore preferable to leave a non-toothed smooth peripheral portion on the ratchet wheel 24 for smooth

contact with the pawl 29 when the pedal 12 is returned to its uppermost standby position.

The cam disc 25 is of a generally gibbous or part-circular shape and has a cam surface 33 engageable with the pawl 29 adjacent to the pin 30 so as to disengage the pawl 29 away from the ratchet teeth 26, for which purpose the pawl 29 has a thickness large enough to extend toward the cam disc 25 beyond the width of the ratchet wheel 24. The cam disc 25 has a maximum outside diameter which is larger than the outside diameter of the ratchet wheel 24.

The ratchet wheel 24 includes a ring member 34 secured by a screw 35 to the axial extension 24a of the ratchet wheel 24 for corotation therewith. The ring member 34 is located at a position to substantially close the open end of the cup-shaped housing 22. The ring member 34 has a pin 36 extending axially therefrom and disposed in a cutaway recess 37 which is formed in the outer periphery of the cam disc 25 at a location diagonally opposite to the ratchet teeth 26 as shown in Figure 3. The cut-away recess 37 is defined between a first end wall 38 and a second end wall 39 of the cam disc 25. The ring member 34 has an outside diameter larger than the outside diameter of the ratchet wheel 24, and the pin 36 is disposed adjacent to the outer periphery of the ring member 34. With this arrangement, only a relatively small force is necessary for turning the cam disc 25 counterclockwise to urge the spring-biased pawl 29 away from the ratchet teeth 26. It is possible however that the pin 36 is provided directly on the ratchet wheel 25 in which instance the cutaway recess 37 extends radially inwardly toward the hub 22b of the housing 22. The circumferential extent of the cutaway recess 37 is determined at a proper value depending on the phase of the cam surface 33 on the cam disc 25 and the ratchet teeth 26 on the ratchet wheel 24.

The ratchet mechanism 13 further includes a detent device composed of a spring-biased stop pin 40 axially movably mounted to housing 22 and projecting radially inwardly from the inner peripheral wall of the cup-shaped housing 22, and a notch 42 formed in the peripheral surface of the cam disc 25 for snugly receiving the stop pin 40 to temporarily hold the cam disc 25 in position against displacement. The stop pin 40 is axially movably retained in a hollow screw 41 threaded to the peripheral wall of the housing 22.

With this construction, the apparatus 10 performs a cycle of operation depicted in Figure 3 through Figure 8. In the first phase of the cycle shown in Figure 3, the foot pedal 12 is retracted to its uppermost standby position in which the pawl 29 is disengaged from the ratchet teeth 26 and located near the first tooth, the pin 36 is held in

Claims

1. A foot-operated press (10) comprising: a punch frame (11); and a foot pedal (12) pivotally supported on said frame (11) and angularly movable between an uppermost standby position and a lowermost clinching position to reciprocate said punch (18), said foot pedal (12) being normally urged toward said standby position, characterized by a ratchet mechanism (13) mounted on a shaft (21), fixedly supported on said frame (11) for operatively interconnecting said foot pedal (12) and said punch (18), said ratchet mechanism (13) including a housing (22) secured to said shaft (21), a ratchet wheel (24) rotatably mounted on said shaft (21) and connected to said foot pedal (12) for movement in unison with said foot pedal (12), said ratchet wheel (24) having a series of external ratchet teeth (26) disposed in said housing (22) and a pin (36) extending parallel to the axis of said shaft (21), a pawl (29) pivotally mounted on said housing (22) and normally urged toward said ratchet wheel (24), said pawl (29) being lockingly engageable with said ratchet teeth (26) to prevent backward movement of said ratchet wheel (24) and hence said foot pedal (12) connected thereto, and a cam disc (25) rotatably disposed in said housing (22) and having a recessed portion (37) loosely receiving said pin (36) and engageable with said pin (36) to turn said cam disc (25) together with said ratchet wheel (24), and further having a cam surface (33) engageable with said pawl (29) to urge the latter away from said ratchet teeth (26).
2. A foot-operated press (10) according to claim 1, said housing (22) having a generally cup-shape, said cam disc (25) being disposed between said ratchet wheel (24) and a closed end of said cup-shaped housing (22), said ratchet wheel (24) including an integral tubular axial extension (24a) projecting outwardly from said housing (22) and attached to said foot pedal (12), and said ratchet wheel (24) including a ring member (34) secured to said axial extension (24a) at a location to close an open end of said cup-shaped housing (22), said pin (36) being disposed on said ring member (34).
3. A foot-operated press (10) according to claim 2, said ring member (34) having an outside diameter larger than the outside diameter of said ratchet wheel (24), said pin (36) disposed adjacent to the outer periphery of said ring member (34).

3. retracting to its initial position remote from the die the cam disc 25, and the punch 18 is lifted or

about the engagement with the first end wall 38 of the cam disc 25, and the punch 18 is lifted or retracting to its initial position remote from the die

Figure 5 shows the third phase in which the pedal 12 has been depressed to a further depth whereby continuing counter-clockwise rotation of the ratchet wheel 24 so that the cam disc 25 begins to turn together with the ratchet wheel 24 by the action of the pin 36 until the pawl 29 reaches the last one of the ratchet teeth 26. In this position, the operator can make sure that clinching is still half-way, as the pedal 12 is retained in that position even if the foot is off the pedal 12.

The fourth phase of operation is illustrated in Figure 6, in which with further rotation of the ratchet wheel 24, the cam surface 33 of the disc 25 abuts against and then urges the pawl 29 to turn clockwise about the pin 30 away from the ratchet teeth 26 against the force of the leaf spring 31. In this position, with the ratchet function terminated, the operator can see to it that fastener elements have been fully clinched together on the substrate as desired.

The fifth phase of operation is shown in Figure 7, in which the pedal 12 is further depressed to forcing the stop pin 40 into the notch 42 thereby locking the disc 25 with the housing 22.

Figure 8 depicts the sixth or final phase of operation in which releasing the foot pedal 12 allows the ratchet wheel 24 to rotate alone in the clockwise direction under the force of the tension spring 20, thereby shifting the pin 36 from the second end wall 39 back to the first end wall 38 of the cam disc 25 while the cam disc 25 is being held immovable by the detent device 40, 42. Since the foot pedal 12 is continuously urged by the tension spring 20 to turn the ratchet wheel in the clockwise direction, the ratchet wheel 24 and the cam disc 25 are then turned clockwise in unison with each other toward the initial position of Figure 3, after forcing stop pin 40 to disengage from notch 42.

abutting engagement with the first end wall 38 of the cam disc 25, and the punch 18 is lifted or retracted to its initial position remote from the die 3.

In the second phase of operation, the foot pedal 12 is depressed to turn the ratchet wheel 24 counterclockwise until the pin 36 reaches the second end wall 39 of the disc 25, in which instance the ram 17 or punch 18 has made a small downward stroke and the pawl 29 has engaged one of the ratchet teeth 26 as shown in Figure 4. This pawl-to-tooth engagement prohibits reverse or clockwise movement of the ratchet wheel 24 upon release of the pedal 12, which would otherwise occur by the action of the tension spring 20 tending to pull back the pedal 12. In this position, therefore, the operator can ascertain that clinching has not yet begun.

Figure 5 shows the third phase in which the pedal 12 has been depressed to a further depth thereby continuing counter-clockwise rotation of the ratchet wheel 24 so that the cam disc 25 begins to turn together with the ratchet wheel 24 by the action of the pin 36 until the pawl 29 reaches the last one of the ratchet teeth 26. In this position, the operator can make sure that clinching is still half-way, as the pedal 12 is retained in that position even if the foot is off the pedal 12.

The fourth phase of operation is illustrated in Figure 6, in which with further rotation of the ratchet wheel 24, the cam surface 33 of the disc 25 abuts against and then urges the pawl 29 to turn clockwise about the pin 30 away from the ratchet teeth 26 against the force of the leaf spring 31. In this position, with the ratchet function terminated, the operator can see to it that fastener elements have been fully clinched together on the substrate as desired.

The fifth phase of operation is shown in Figure 7, in which the pedal 12 is further depressed to bring the stop pin 40 into the notch 42 thereby locking the disc 25 with the housing 22.

Figure 8 depicts the sixth or final phase of operation in which releasing the foot pedal 12 allows the ratchet wheel 24 to rotate alone in the clockwise direction under the force of the tension spring 20, thereby shifting the pin 36 from the second end wall 39 back to the first end wall 38 of the cam disc 25 while the cam disc 25 is being held immovable by the detent device 40, 42. Since the foot pedal 12 is continuously urged by the tension spring 20 to turn the ratchet wheel in the clockwise direction, the ratchet wheel 24 and the cam disc 25 are then turned clockwise in unison with each other toward the initial position of Figure 3, after forcing stop pin 40 to disengage from notch 42.

## Claims

1. A foot-operated press (10) comprising: a punch (18) vertically reciprocally supported on a frame (11); and a foot pedal (12) pivotably supported on said frame (11) and angularly movable between an uppermost standby position and a lowermost clinching position to reciprocate said punch (18), said foot pedal (12) being normally urged toward said standby position, characterized by a ratchet mechanism (13) mounted on a shaft (21) fixedly supported on said frame (11) for operatively interconnecting said foot pedal (12) and said punch (18), said ratchet mechanism (13) including a housing (22) secured to said shaft (21), a ratchet wheel (24) rotatably mounted on said shaft (21) and connected to said foot pedal (12) for movement in unison with said foot pedal (12), said ratchet wheel (24) having a series of external ratchet teeth (26) disposed in said housing (22) and a pin (36) extending parallel to the axis of said shaft (21), a pawl (29) pivotably mounted on said housing (22) and normally urged toward said ratchet wheel (24), said pawl (29) being lockingly engageable with said ratchet teeth (26) to prevent backward movement of said ratchet wheel (24) and hence said foot pedal (12) connected thereto, and a cam disc (25) rotatably disposed in said housing (22) and having a recessed portion (37) loosely receiving said pin (36) and engageable with said pin (36) to turn said cam disc (25) together with said ratchet wheel (24), and further having a cam surface (33) engageable with said pawl (29) to urge the latter away from said ratchet teeth (26).
2. A foot-operated press (10) according to claim 1, said housing (22) having a generally cup-shape, said cam disc (25) being disposed between said ratchet wheel (24) and a closed end of said cup-shaped housing (22), said ratchet wheel (24) including an integral tubular axial extension (24a) projecting outwardly from said housing (22) and attached to said foot pedal (12), and said ratchet wheel (24) including a ring member (34) secured to said axial extension (24a) at a location to close an open end of said cup-shaped housing (22), said pin (36) being disposed on said ring member (34).
3. A foot-operated press (10) according to claim 2, said ring member (34) having an outside diameter larger than the outside diameter of said ratchet wheel (24), said pin (36) disposed adjacent to the outer periphery of said ring member (34).

4. A foot-operated press (10) according to claim 1, 2 or 3, said housing (22) having a generally cup-shape and including a central hub (22a) disposed inside said cup-shaped housing (22), said cam disc (25) being rotatably fitted around said hub (22a).

5. A foot-operated press (10) according to any preceding claim, said pawl (29) being normally held out of engagement with said ratchet teeth (26), which are provided on a limited peripheral area of said ratchet wheel (24).

6. A foot-operated press (10) according to any preceding claim, said housing (22) having a generally cup-shape and including a cut-away peripheral portion (27) and a pair of confronting flanges (28, 28) defining said cut-away peripheral portion (27), said pawl (29) being disposed in said cut-away peripheral portion (27).

7. A foot-operated press (10) according to claim 6, including a leaf spring (31) secured at its one end to said housing (22) and acting on said pawl (29) to urge the latter against said ratchet wheel (24).

8. A foot-operated press (10) according to claim 7, said leaf spring (31) having a width slightly smaller than the distance between said flanges (28, 28).

9. A foot-operated press (10) according to any preceding claim, said ratchet mechanism (13) including a detent device for temporarily arresting movement of said cam disc (25), said detent device comprising a spring-biased Pin (40) axially movably mounted to said housing (22) and projecting radially inwardly toward a peripheral surface of said cam disc (25), and a notch (42) defined in said peripheral surface of said cam disc (25) and snugly receptive of said spring-biased pin (40).

#### Revendications

1. Presse actionnée au pied (10) comportant : un poinçon (18) supporté de façon à pouvoir effectuer des va-et-vient verticaux sur un bâti (11) ; et une pédale (12) supportée de façon à pouvoir pivoter sur ledit bâti (11) et mobile angulairement entre une position de repos supérieure et une position de sertissage inférieure afin de faire effectuer un mouvement de va-et-vient audit poinçon (18), ladite pédale (12) étant normalement mise dans ladite position de repos, caractérisée par un mécanisme à cliquet (13) monté sur un arbre (21) supporté

de façon fixe sur ledit bâti (11) pour interconnecter de façon opérationnelle ladite pédale (12) et ledit poinçon (18), ledit mécanisme à cliquet (13) comprenant un boîtier (22) fixé audit arbre (21), une roue à rochet (24) montée de façon à pouvoir tourner sur ledit arbre (21) et connectée à ladite pédale (12) pour se déplacer à l'unisson avec ladite pédale (12), ladite roue à rochet (24) ayant une série de dents de rochet extérieures (26) disposées dans ledit boîtier (22) et une broche (36) s'étendant parallèlement à l'axe dudit arbre (21), un cliquet (29) monté de façon à pouvoir pivoter sur ledit boîtier (22) et normalement poussé vers ladite roue à rochet (24), ledit cliquet (29) pouvant s'engrener de façon à effectuer un verrouillage avec lesdites dents de rochet (26) afin d'empêcher le déplacement vers l'arrière de ladite roue à rochet (24), et, de ce fait, de ladite pédale (12) connectée à celle-ci, et un disque à came (25) disposé de façon à pouvoir tourner dans ledit boîtier (22) et ayant une partie en cavité (37) recevant de façon lâche ladite broche (36) et pouvant s'engrener avec ladite broche (36) pour faire tourner ledit disque à came (25) avec ladite roue à rochet (24), et possédant de plus une surface de came (33) pouvant s'engrener avec ledit cliquet (29) afin d'éloigner ce dernier desdites dents de rochet (26).

2. Presse actionnée au pied (10) selon la revendication 1, ledit boîtier (22) ayant une forme globale de coupe, ledit disque à came (25) étant disposé entre ladite roue à rochet (24) et une extrémité fermée dudit boîtier (22) en forme de coupe, ladite roue à rochet (24) comprenant un prolongement axial tubulaire d'une seule pièce (24a) s'étendant vers l'extérieur à partir dudit boîtier (22) et fixé à ladite pédale (12), et ladite roue à rochet (24) comprenant un élément en forme d'anneau (34) fixé audit prolongement axial (24a) en un emplacement permettant de fermer une extrémité ouverture dudit boîtier (22) en forme de coupe, ladite broche (36) étant disposée sur ledit élément en forme d'anneau (34).

3. Presse actionnée au pied (10) selon la revendication 2, ledit élément en forme d'anneau (34) ayant un diamètre extérieur supérieur au diamètre extérieur de ladite roue à rochet (24), ladite broche (36) étant disposée au voisinage de la périphérie extérieure dudit élément en forme d'anneau (34).

4. Presse actionnée au pied (10) selon la revendication 1, 2 ou 3, ledit boîtier (22) ayant une

forme globale de coupe et comprenant un moyeu central (22a) disposé à l'intérieur dudit boîtier (22) en forme de coupe, ledit disque à came (25) étant fixé de façon à pouvoir tourner autour dudit moyeu (22a).

5. Presse actionnée au pied (10) selon l'une quelconque des revendications précédentes, ledit cliquet (29) étant normalement maintenu non engrené avec lesdites dents de rochet (26) qui sont disposées sur une zone périphérique limitée de ladite roue à rochet (24).

6. Presse actionnée au pied (10) selon l'une quelconque des revendications précédentes, ledit boîtier (22) ayant une forme globale de coupe et comprenant une partie périphérique découpée (27) et une paire de flasques en vis-à-vis (28, 28) définissant ladite partie périphérique découpée (27), ledit cliquet (29) étant disposé dans ladite partie périphérique découpée (27).

7. Presse actionnée au pied (10) selon la revendication 6, comprenant un ressort à lames (31) fixé à sa première extrémité audit boîtier (22) et agissant sur ledit cliquet (29) de façon à pousser ce dernier contre ladite roue à rochet (24).

8. Presse actionnée au pied (10) selon la revendication 7, ledit ressort à lames (31) étant d'une largeur légèrement inférieure à la distance entre lesdites flasques (28, 28).

9. Presse actionnée au pied (10) selon l'une quelconque des revendications précédentes, ledit mécanisme de cliquet (13) comprenant un dispositif de détente pour arrêter de façon temporaire le déplacement dudit disque à came (25), ledit dispositif de détente comportant une broche (40) mobile axialement et montée sur ledit boîtier, s'étendant radialement vers l'intérieur en direction d'une surface périphérique dudit disque à came (25), et une encoche (42) définie dans ladite surface périphérique dudit disque à came (25) et recevant de façon à ce qu'elle affleure ladite broche chargée par un ressort (40).

#### Patentansprüche

1. Fußbetätigbare Presse (10) mit einem von einem Rahmen (11) senkrecht hin und her beweglich getragenen Stempel (18), einem Fußpedal (12), das schwenkbar an diesem Rahmen befestigt ist und im Winkel zwischen einer oberen Bereitschaftsstellung und einer unteren Preßstellung bewegt werden kann, um den

Stempel (18) hin und her zu bewegen, wobei das Fußpedal (12) normalerweise in die Bereitschaftsstellung gezwungen wird, gekennzeichnet durch eine Sperrvorrichtung (13), die auf einer fest mit dem Rahmen (11) verbundenen Welle (21) angebracht ist und das Fußpedal (12) wirksam mit dem Stempel (18) verbindet, wobei die Sperrvorrichtung (13) ein an der Welle (21) befestigtes Gehäuse (22), ein drehbar auf der Welle (21) angebrachtes Klinkenrad (24), das mit dem Fußpedal (12) verbunden und gemeinsam mit diesem bewegbar ist, wobei dieses Klinkenrad (24) eine Reihe von äußeren Klinkenzähnen (26), die sich im Gehäuse (22) befinden, sowie einen Stift (36) aufweist, der parallel zu der Welle (21) verläuft, eine schwenkbar an dem Gehäuse (22) angebrachte Sperrklinke (29), die normalerweise gegen das Klinkenrad (24) gedrückt wird, wobei die Sperrklinke (29) mit den Klinkenzähnen (26) in Sperreingriff gebracht werden kann, um eine Rückwärtsbewegung des Klinkenrades (24) und damit des mit diesem verbundenen Fußpedals (12) zu verhindern, und eine drehbar im Gehäuse (22) angeordnete Kurvenscheibe (25) umfaßt, die mit einer Aussparung (37) versehen ist, die den Stift (36) lose aufnimmt und von diesem so erfaßbar ist, daß die Kurvenscheibe (25) zusammen mit dem Klinkenrad (24) gedreht wird, und ferner eine Kurvenfläche (33) besitzt, welche die Sperrklinke (29) von den Klinkenzähnen (26) fernhält.

2. Fußbetätigbare Presse nach Anspruch 1, wobei das Gehäuse (22) allgemein eine Schalenform besitzt, die Kurvenscheibe (25) zwischen dem Klinkenrad (24) und einem geschlossenen Ende des schalenförmigen Gehäuses (22) angeordnet ist, und an das Klinkenrad (24) eine rohrförmige, axiale Verlängerung (24a) angeformt ist, die vom Gehäuse (22) nach außen vorsteht und mit dem Fußpedal (12) verbunden ist, und das Klinkenrad (24) ein Ringglied (34) aufweist, das an der axialen Verlängerung (24a) an einer solchen Stelle befestigt ist, daß ein offenes Ende des schalenförmigen Gehäuses (22) verschlossen wird, und der Stift (36) auf diesem Ringglied (34) angebracht ist.

3. Fußbetätigbare Presse nach Anspruch 2, wobei das Ringglied (34) einen größeren Außendurchmesser besitzt als das Klinkenrad (24) und der Stift (36) angrenzend an die äußere Peripherie des Ringgliedes (34) angeordnet ist.

4. Fußbetätigbare Presse nach einem der Ansprüche 1 bis 3, wobei das im allgemeinen schalenförmige Gehäuse (22) eine zentrale

Nabe (22a) aufweist, die im Inneren des schalenförmigen Gehäuses (22) angebracht ist und die Kurvenscheibe (25) drehbar um diese Nabe angepaßt ist.

5. Fußbetätigbare Presse nach einem der vorstehenden Ansprüche, wobei die Sperrklinke (29) normalerweise außer Eingriff mit den Klinkenzähnen (26), die sich auf einem begrenzten äußeren Bereich des Klinkenrads (24) befinden, gehalten ist. 5  
10
6. Fußbetätigbare Presse nach einem der vorstehenden Ansprüche, wobei das Gehäuse (22) allgemein schalenförmig ist und einen ausgeschnittenen Umfangsabschnitt (27) sowie zwei einander gegenüberstehende, diesen ausgeschnittenen Umfangsabschnitt (27) begrenzende Flansche (28, 28) besitzt, wobei die Sperrklinke (29) in diesem ausgeschnittenen Umfangsabschnitt (27) angeordnet ist. 15  
20
7. Fußbetätigbare Presse nach Anspruch 6, mit einer Blattfeder (31), die an ihrem einen Ende an dem Gehäuse (22) befestigt ist und auf die Sperrklinke (29) einwirkt, um diese gegen das Klinkenrad (24) zu drücken. 25
8. Fußbetätigbare Presse nach Anspruch 7, wobei die Blattfeder (31) eine geringfügig kleinere Breite als der Abstand zwischen den beiden Flanschen (28, 28) hat. 30
9. Fußbetätigbare Presse nach einem der vorstehenden Ansprüche, wobei die Sperrvorrichtung (13) eine Feststellvorrichtung zur zeitweisen Sperrung der Bewegung der Kurvenscheibe (25) besitzt, wobei diese Feststellvorrichtung einen mittels einer Feder vorgespannten Stift (40) aufweist, der axial beweglich an dem Gehäuse (22) angebracht ist und radial nach innen gegen eine äußere Oberfläche der Kurvenscheibe (25) vorsteht, und die eine Kerbe (42) besitzt, welche sich in der Umfangsfläche der Kurvenscheibe (25) befindet und den vorgespannten Bolzen (40) eng anliegend aufnehmen kann. 35
