

CAMERA MODULE AND ELECTRONIC DEVICE COMPRISING SAME

【Abstract】

A camera module according to an embodiment includes a camera
5 housing, a lens assembly, part of which is accommodated in the camera housing,
the lens assembly including a lens, in which the lens assembly moves in a
direction of an optical axis of the lens inside the camera housing, and a stopper
member coupled to the inside of the camera housing and at least part of the
stopper member limits a movement range of the lens assembly in the direction
10 of the optical axis. The stopper member includes a first stopper member to limit
the movement range of the lens assembly in a first optical axis direction and a
second stopper member to limit the movement range of the lens assembly in a
second optical axis direction opposite to the first optical axis direction, and the
first stopper member and the second stopper member are configured to provide
15 damping when the lens assembly makes contact with the first stopper member
and the second stopper member.
