

[Title of Invention] MANAGEMENT SERVER, SYSTEM, TOKEN
ISSUANCE METHOD, AND STORAGE MEDIUM

[Document Name] ABSTRACT

5 Provided is a management server that excludes a user who is not
qualified to use a boarding system utilizing biometric authentication. The
management server includes a receiving unit and a generation unit. The
receiving unit receives, from a terminal, a token issuance request including
at least boarding pass information written on a boarding pass, and passport
10 information written on a passport. The generation unit makes a first
determination about consistency between the boarding pass information and
the passport information, and generates, on the basis of the result of the
first determination, a token for a user to use a boarding process utilizing
biometric information.
