FIELD OF THE INVENTION

The present invention provides novel carboxylic acid substituted pyrrolidine
10 compounds, and their analogues thereof, which are GPR40 G protein-coupled receptor
modulators, compositions containing them, and methods of using them, for example, for
the treatment of diabetes and related conditions.

BACKGROUND OF THE INVENTION

15 Diabetes mellitus is a progressively debilitating disorder of epidemic proportions
leading to various micro- and macrovascular complications and morbidity. The most
common type of diabetes, type 2 diabetes, is characterized by increasing insulin
resistance associated with inadequate insulin secretion after a period of compensatory
hyperinsulinemia. Free fatty acids (FFAs) are evidenced to influence insulin secretion
20 from β cells primarily by enhancing glucose-stimulated insulin secretion (GSIS). G-
protein coupled receptors (GPCRs) expressed in β cells are known to modulate the
release of insulin in response to changes in plasma glucose levels. GPR40, also known as
fatty acid receptor 1 (FFAR1), is a membrane-bound FFA receptor which is preferentially
expressed in the pancreatic islets and specifically in β cells and mediates medium to long
25 chain fatty acid induced insulin secretion. GPR40 is also expressed in enteroendocrine
cells wherein activation promotes the secretion of gut incretin hormones, such as GLP-1,
GIP, CCK and PYY. To decrease medical burden of type 2 diabetes through enhanced
glycemic control, GPR40 modulator compounds hold the promise of exerting an incretin
effect to promote GSIS as well as potential combination with a broad range of
30 antidiabetic drugs.

The present invention relates to novel substituted pyrrolidine compounds which have the ability to modulate GPR40. Such compounds are therefore potentially useful for the treatment of diabetes and related conditions.

20 III. CHEMISTRY

Throughout the specification, examples and the appended claims, a given chemical formula or name shall encompass all stereo and optical isomers and racemates thereof where such isomers exist. The term "stereoisomer(s)" refers to compound(s) which have identical chemical constitution, but differ with regard to the arrangement of

the atoms or groups in space. Unless otherwise indicated, all chiral (enantiomeric and diastereomeric) and racemic forms are within the scope of the invention. The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner. The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

Many geometric isomers of C=C double bonds, C=N double bonds, ring systems, and the like can also be present in the compounds, and all such stable isomers are contemplated in the present invention. *Cis*- and *trans*- (or *E*- and *Z*-) geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms.

The present compounds can be isolated in optically active or racemic forms. Optically active forms may be prepared by resolution of racemic forms or by synthesis from optically active starting materials. All processes used to prepare compounds of the present invention and intermediates made therein are considered to be part of the present invention. When enantiomeric or diastereomeric products are prepared, they may be separated by conventional methods, for example, by chromatography or fractional crystallization.

Depending on the process conditions the end products of the present invention are obtained either in free (neutral) or salt form. Both the free form and the salts of these end products are within the scope of the invention. If so desired, one form of a compound may be converted into another form. A free base or acid may be converted into a salt; a salt may be converted into the free compound or another salt; a mixture of isomeric compounds of the present invention may be separated into the individual isomers. Compounds of the present invention, free form and salts thereof, may exist in multiple tautomeric forms, in which hydrogen atoms are transposed to other parts of the molecules and the chemical bonds between the atoms of the molecules are consequently rearranged. It should be understood that all tautomeric forms, insofar as they may exist, are included within the invention.

Unless otherwise indicated, any heteroatom with unsatisfied valences is assumed to have hydrogen atoms sufficient to satisfy the valences.

As used herein, the term "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms. For example, "C₁ to C₆ alkyl" or "C₁₋₆ alkyl" denotes alkyl having 1 to 6 carbon atoms. Alkyl group can be unsubstituted or substituted with at least one hydrogen being replaced by another chemical group. Preferred carbocycles, unless otherwise specified, are cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, phenyl, indanyl, and tetrahydronaphthyl. When the term "carbocycle" is used, it is intended to include "aryl". A bridged ring occurs when one or more, preferably one to three, carbon atoms link two non-adjacent carbon atoms. Preferred bridges are one or two carbon atoms. It is noted that a bridge always converts a monocyclic ring into a

tricyclic ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge.

As used herein, the term "bicyclic carbocycle" or "bicyclic carbocyclic group" is intended to mean a stable 9- or 10-membered carbocyclic ring system that contains two fused rings and consists of carbon atoms. Of the two fused rings, one ring is a benzo ring fused to a second ring; and the second ring is a 5- or 6-membered carbon ring which is saturated, partially unsaturated, or unsaturated. The bicyclic carbocyclic group may be attached to its pendant group at any carbon atom which results in a stable structure. The bicyclic carbocyclic group described herein may be substituted on any carbon if the resulting compound is stable. Examples of a bicyclic carbocyclic group are, but not limited to, naphthyl, 1,2-dihydronaphthyl, 1,2,3,4-tetrahydronaphthyl, and indanyl.

"Aryl" groups refer to monocyclic or bicyclic aromatic hydrocarbons, including, for example, phenyl, and naphthyl. Aryl moieties are well known and described, for example, in Lewis, R.J., ed., *Hawley's Condensed Chemical Dictionary*, 13th Edition, John Wiley & Sons, Inc., New York (1997). "C₆₋₁₀ aryl" refers to phenyl and naphthyl.

The term "benzyl", as used herein, refers to a methyl group on which one of the hydrogen atoms is replaced by a phenyl group.

The nitrogen atom may be substituted or unsubstituted (*i.e.*, N or NR wherein R is H or another substituent, if defined). The heterocyclic ring may be attached to its pendant group at any heteroatom or carbon atom that results in a stable structure. The heterocyclic rings described herein may be substituted on carbon or on a nitrogen atom if the resulting compound is stable. A nitrogen in the heterocycle may optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. Of the two fused rings, one ring is a 5- or 6-membered monocyclic aromatic ring comprising a 5-membered heteroaryl ring, a 6-membered heteroaryl ring or a benzo ring, each fused to a second ring. The second ring is a 5- or 6-membered monocyclic ring which is saturated, partially unsaturated, or unsaturated, and comprises a 5-membered heterocycle, a 6-membered heterocycle or a carbocycle (provided the first ring is not benzo when the second ring is a carbocycle).

Bridged rings are also included in the definition of heterocycle. A bridged ring occurs when one or more, preferably one to three, atoms (*i.e.*, C, O, N, or S) link two non-adjacent carbon or nitrogen atoms. Examples of bridged rings include, but are not limited to, one carbon atom, two carbon atoms, one nitrogen atom, two nitrogen atoms, and a carbon-nitrogen group. It is noted that a bridge always converts a monocyclic ring into a tricyclic ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge.

The term "counter ion" is used to represent a negatively charged species such as chloride, bromide, hydroxide, acetate, and sulfate or a positively charged species such as sodium (Na⁺), potassium (K⁺), calcium (Ca²⁺), ammonium (R_nNH_m⁺ where n=0-4 and m=0-4) and the like.

As used herein, the term "amine protecting group" means any group known in the art of organic synthesis for the protection of amine groups which is stable to an ester reducing agent, a disubstituted hydrazine, R₄-M and R₇-M, a nucleophile, a hydrazine reducing agent, an activator, a strong base, a hindered amine base and a cyclizing agent. Such amine protecting groups fitting these criteria include those listed in Wuts, P.G.M. et al., *Protecting Groups in Organic Synthesis*, Fourth Edition, Wiley (2007) and *The*

Peptides: Analysis, Synthesis, Biology, Vol. 3, Academic Press, New York (1981), the disclosure of which is hereby incorporated by reference. Examples of amine protecting groups include, but are not limited to, the following: (1) acyl types such as formyl, trifluoroacetyl, phthalyl, and p-toluenesulfonyl; (2) aromatic carbamate types such as benzyloxycarbonyl (Cbz) and substituted benzyloxycarbonyls, 1-(p-biphenyl)-1-methylethoxycarbonyl, and 9-fluorenylmethyloxycarbonyl (Fmoc); (3) aliphatic carbamate types such as *tert*-butyloxycarbonyl (Boc), ethoxycarbonyl, diisopropylmethoxycarbonyl, and allyloxycarbonyl; (4) cyclic alkyl carbamate types such as cyclopentyloxycarbonyl and adamantyloxycarbonyl; (5) alkyl types such as triphenylmethyl and benzyl; (6) trialkylsilane such as trimethylsilane; (7) thiol containing types such as phenylthiocarbonyl and dithiasuccinoyl; and (8) alkyl types such as triphenylmethyl, methyl, and benzyl; and substituted alkyl types such as 2,2,2-trichloroethyl, 2-phenylethyl, and *t*-butyl; and trialkylsilane types such as trimethylsilane.

As referred to herein, the term "substituted" means that at least one hydrogen atom is replaced with a non-hydrogen group, provided that normal valencies are maintained and that the substitution results in a stable compound. Ring double bonds, as used herein, are double bonds that are formed between two adjacent ring atoms (*e.g.*, C=C, C=N, or N=N).

In cases wherein there are nitrogen atoms (*e.g.*, amines) on compounds of the present invention, these may be converted to N-oxides by treatment with an oxidizing agent (*e.g.*, mCPBA and/or hydrogen peroxides) to afford other compounds of this invention. Thus, shown and claimed nitrogen atoms are considered to cover both the shown nitrogen and its N-oxide (N→O) derivative.

When any variable occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-3 R, then said group may optionally be substituted with up to three R groups, and at each occurrence R is selected independently from the definition of R.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom in which such substituent is bonded to the rest of the

compound of a given formula, then such substituent may be bonded via any atom in such substituent.

Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

5 The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms that are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, and/or other problem or complication, commensurate with a reasonable benefit/risk ratio.

10 Compounds of the present invention can form salts which are also within the scope of this invention. Unless otherwise indicated, reference to an inventive compound is understood to include reference to one or more salts thereof. Pharmaceutically acceptable salts are preferred. However, other salts may be useful, *e.g.*, in isolation or purification steps which may be employed during preparation, and thus, are contemplated
15 within the scope of the invention.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic groups such as amines; and alkali or organic salts
20 of acidic groups such as carboxylic acids. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, and nitric; and the salts
25 prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, and isethionic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized
30 from the parent compound that contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in

water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Allen, L.V., Jr., ed., *Remington: The Science and Practice of Pharmacy*, 22nd Edition, Pharmaceutical Press, London, UK (2012), the disclosure of which is hereby incorporated by reference.

In addition, compounds of formula I may have prodrug forms. Any compound that will be converted *in vivo* to provide the bioactive agent (*i.e.*, a compound of Formula (I)) is a prodrug within the scope and spirit of the invention. Various forms of prodrugs are well known in the art. For examples of such prodrug derivatives, see:

Compounds containing a carboxy group can form physiologically hydrolyzable esters that serve as prodrugs by being hydrolyzed in the body to yield Formula (I) compounds *per se*. Such prodrugs are preferably administered orally since hydrolysis in many instances occurs principally under the influence of the digestive enzymes. Parenteral administration may be used where the ester *per se* is active, or in those instances where hydrolysis occurs in the blood. Examples of physiologically hydrolyzable esters of compounds of formula I include C₁₋₆alkyl, C₁₋₆alkylbenzyl, 4-methoxybenzyl, indanyl, phthalyl, methoxymethyl, C₁₋₆ alkanoyloxy-C₁₋₆alkyl (*e.g.*, acetoxymethyl, pivaloyloxymethyl or propionyloxymethyl), C₁₋₆alkoxycarbonyloxy-C₁₋₆alkyl (*e.g.*, methoxycarbonyl-oxymethyl or ethoxycarbonyloxymethyl, glycyloxymethyl, phenylglycyloxymethyl, (5-methyl-2-oxo-1,3-dioxolen-4-yl)-methyl),

and other well known physiologically hydrolyzable esters used, for example, in the penicillin and cephalosporin arts. Such esters may be prepared by conventional techniques known in the art.

Preparation of prodrugs is well known in the art and described in, for example, King, F.D., ed., *Medicinal Chemistry: Principles and Practice*, The Royal Society of Chemistry, Cambridge, UK (Second Edition, reproduced (2006)); Testa, B. et al., *Hydrolysis in Drug and Prodrug Metabolism. Chemistry, Biochemistry and Enzymology*, VCHA and Wiley-VCH, Zurich, Switzerland (2003); Wermuth, C.G., ed., *The Practice of Medicinal Chemistry*, Third Edition, Academic Press, San Diego, CA (2008).

The present invention also includes isotopically-labeled compounds of the invention, wherein one or more atoms is replaced by an atom having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds of the invention include isotopes of hydrogen, such as ^2H (also represented as 'D' for deuterium) and ^3H , carbon such as ^{11}C , ^{13}C , and ^{14}C , nitrogen, such as ^{13}N and ^{15}N , oxygen, such as ^{15}O , ^{17}O , and ^{18}O . Certain isotopically-labeled compounds of the invention, for example, those incorporating a radioactive isotope, are useful in drug and/or substrate tissue distribution studies. The radioactive isotopes tritium, ^3H , and carbon-14, ^{14}C , are particularly useful for this purpose in view of their ease of incorporation and ready means of detection. Substitution with heavier isotopes such as deuterium, ^2H , may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increase *in vivo* half-life or reduced dosage requirements, and hence may be preferred in some circumstances. Substitution with positron emitting isotopes, such as ^{11}C , ^{15}O , and ^{13}N , can be useful in Positron Emission Topography (PET) studies for examining substrate receptor occupancy. Isotopically-labeled compounds of the invention can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described herein, using an appropriate isotopically-labeled reagent in place of the non-labeled reagent otherwise employed.

The compounds of the present invention can be prepared in a number of ways known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or by variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are performed in a solvent or solvent mixture appropriate to the reagents and materials employed and suitable for the transformations being effected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention.

The novel compounds of this invention may be prepared using the reactions and techniques described in this section. Also, in the description of the synthetic methods described below, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the art. Restrictions to the substituents that are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternate methods must then be used.

Compounds of Formula (I) may be synthesized starting with pyrrolidines A *via*
5 coupling to intermediate B using, for example, CuI and NaOH to give prolinol C, as
depicted in Scheme 1. Activation of intermediate C, *via* methanesulfonyl chloride and
base, for example, and displacement with sodium cyanide leads to nitrile D. Removal of
P.G. on intermediate D, such as hydrogenolysis (when P.G. is a benzyl ether), gives
phenol E. R¹ group of intermediate J is appended *via* displacement of L.G. in
10 intermediate F *via* amine H using S-Phos precatalyst and base, such as LiHMDS or,
optionally *via* uncatalyzed displacement of L.G. The hydroxyl of amine J can be
activated with, for example, para-toluenesulfonyl chloride and base, such as pyridine, to
give tosylate K. Intermediate K and phenol E can be coupled using a base, such as
Cs₂CO₃, to give intermediate L. The cyano or methyl ester group can be hydrolyzed *via*
15 NaOH, for example, to provide compounds of Formula (I).

Scheme 1

- Compounds of Formula (I) can be synthesized by reaction of alcohol J with phenol E *via* a Mitsunobu reaction using an azodicarboxylate, such as ADDP, and a phosphine (*e.g.*, Bu_3P) as demonstrated in Scheme 2 to give compound L. The intermediate L can be converted to compounds of Formula (I) by hydrolysis with base, such as $NaOH$.

Scheme 2

Compounds of Formula (I) may be synthesized beginning with ketone CC, which
 5 can be reduced to alcohol H by a hydride source or dynamic kinetic resolution using
 glucose dehydrogenase, for example, followed by deprotection of the P.G. by
 hydrogenolysis (when P.G. is a benzyl group) as shown in Scheme 2.2. Displacement of
 a L.G., such as a chloride, on compound F using a base, such as K₂CO₃, provides
 compound J. The hydroxyl of compound J can displace a L.G. on intermediate DD using
 10 a base, such as KOtBu, to give compound EE. The nitro group can be reduced *via* Fe and
 NH₄Cl, for example, to give amine FF.

Acylated chiral auxiliary HH can be reacted with 2,2-dimethoxyacetaldehyde GG
 using a Lewis acid, such as TiCl₄ or Bu₂BOTf along with a base, such as DIPEA, to give
 aldol product JJ. The chiral auxiliary is removed using AlMe₃ and *N,O*-
 15 dimethylhydroxylamine hydrochloride to provide Weinreb amide KK. Intermediate KK
 can be alkylated with intermediate LL using a base, such as NaH, and a phase transfer
 reagent, such as TBAF, to give intermediate MM. The Weinreb amide MM can be
 reacted with a hydride reagent, such as DIBAL-H, to give aldehyde NN. Intermediate
 NN can undergo reaction with CBr₄ and Ph₃P to give dibromide OO. The dibromide OO
 20 can be reacted with a base, such as *n*-BuLi, and an acylating reagent, such as ethyl
 chloroformate, to give alkyne PP. The alkyne can be hydrogenated using a Pd catalyst,
 such as Lindlar catalyst, to give alkene QQ. The acetal group of intermediate QQ can be
 removed using aqueous acid, such as HCl, to give aldehyde RR. This aldehyde can
 undergo reductive amination with amine FF using a hydride source, such as
 25 NaBH(OAc)₃, to provide amine SS. Amine SS can undergo cyclization to intermediate L
 using a base, such as NaOtBu. Hydrolysis of ester L *via* LiOH, for example, can provide
 compounds of Formula (I).

Scheme 2.2

Alternatively, compounds of Formula (I) may be synthesized starting with ethyl 1-benzyl-4-oxopiperidine-3-carboxylate (intermediate M), which can be reacted with R²-L.G., as in intermediate N, using a base, such as KOtBu, to provide β-ketoester O as depicted in Scheme 3. The ester can be removed *via* decarboxylation with acid, *e.g.*,

- HCl, to provide piperidinone P. The methyl iodonium salt Q can be formed from piperidinone P using MeI. The salt Q can be converted to the piperidinone S by reaction with an amine R and base (*e.g.*, K_2CO_3). The ketone S can be reduced using a hydride source, such as $NaBH_4$, to give alcohol J. Alcohol J can be converted to compounds of Formula (I) according to the sequence depicted in Scheme 1 or Scheme 2.

Scheme 3

- Compounds of Formula (IIIa) may be synthesized *via* reaction of pyrrolidine T with NaDCC followed by elimination using a base (*e.g.*, NEt_3) as depicted in Scheme 4. The resultant intermediate U can be protected with a protecting group and base (*e.g.*, 2,6-lutidine) to give V. A Michael reaction with a Grignard or alkyl lithium reagent W and $CuBr \cdot SMe_2$ gives intermediate X. Deprotection of intermediate X reveals hydroxyl Y, which can be alkylated with an alkoxyalkyl group Z and base, such as NaH to give AA. The ester can be reduced with a hydride source, such as $LiBH_4$, and then the protecting group on the nitrogen can be removed. The resultant intermediate BB can be converted to Formula (IIIa) *via* an analogous sequence to those shown in Schemes 1 or 2.

IV. BIOLOGY

Diabetes mellitus is a serious disease afflicting over 100 million people worldwide. It is diagnosed as a group of disorders characterized by abnormal glucose homeostasis resulting in elevated blood glucose. Diabetes is a syndrome with interrelated metabolic, vascular, and neuropathic components. The metabolic abnormality is generally characterized by hyperglycemia and alterations in carbohydrate, fat and protein metabolism caused by absent or reduced insulin secretion and/or ineffective insulin secretion. The vascular syndrome consists of abnormalities in the blood vessels leading to cardiovascular, retinal and renal complications. Abnormalities in the peripheral and autonomic nervous systems are also part of diabetic syndrome. Strikingly, diabetes is the fourth leading cause of global death by disease, the largest cause of kidney failure in developed countries, the leading cause of vision loss in industrialized countries and has the greatest prevalence increase in developing countries.

Type 2 diabetes, which accounts for 90% of diabetes cases, is characterized by increasing insulin resistance associated with inadequate insulin secretion after a period of compensatory hyperinsulinemia. The reasons for β cell secondary failure are not completely understood. Acquired pancreatic islet damage or exhaustion and/or genetic factors causing susceptibility to islet secretory insufficiency have been hypothesized.

Free fatty acids (FFAs) are evidenced to influence insulin secretion from β cells primarily by enhancing glucose-stimulated insulin secretion (GSIS). Although glucose is recognized as the major stimulator of insulin secretion from β cells, other stimuli, such as amino acids, hormones, and FFAs, also regulate insulin secretion. Thus, under normal settings, insulin secretion from β cells in response to food intake is evoked by the collective stimuli of nutrients, such as glucose, amino acids, and FFAs, and hormones like the incretin glucagon-like peptide 1 (GLP-1). Fatty acids are also known to stimulate the secretion of several gut satiety hormones, including cholecystokinin (CCK), GLP-1, and peptide YY (PYY).

G-protein coupled receptors (GPCRs) expressed in β cells are known to modulate the release of insulin in response to changes in plasma glucose levels. GPR40, also known as fatty acid receptor 1 (FFAR1), is a membrane-bound FFA receptor which is preferentially expressed in the pancreatic islets and specifically in β cells. GPR40 (*e.g.*, human GPR40, RefSeq mRNA ID NM_005303; *e.g.*, mouse GPR40 RefSeq mRNA ID NM_194057) is a GPCR located at chromosome 19q13.12. GPR40 is activated by medium to long chain fatty acids and thereby triggering a signaling cascade that results in increased levels of $[Ca^{2+}]_i$ in β cells and subsequent stimulation of insulin secretion (Itoh et al., *Nature*, 422:173-176 (2003)). Selective small molecule agonists of GPR40 have been shown to promote GSIS and reduce blood glucose in mice (Tan et al., *Diabetes*, 57:2211-2219 (2008)). Briefly, when activators of GPR40 are administered to either normal mice or mice that are prone to diabetes due to genetic mutation, prior to a glucose tolerance test, improvements in glucose tolerance are observed. A short-lived increase in plasma insulin levels are also observed in these treated mice. It has also been shown that GPR40 agonists restore GSIS in pancreatic β -cells from the neonatal STZ rats suggesting that GPR40 agonists will be efficacious in diabetics with compromised β -cell function and mass. Fatty acids are known to stimulate the secretion of several gut satiety hormones, including cholecystokinin (CCK), GLP-1, and peptide YY (PYY), and GPR40 has been shown to colocalize with cells that secrete such hormones (Edfalk et al., *Diabetes*, 57:2280-2287 (2008); Luo et al., *PLoS ONE*, 7:1-12 (2012)). Fatty acids are also known to play a role in neuronal development and function, and GPR40 has been reported as a potential modulator of the fatty acid effects on neurons (Yamashima, T., *Progress in Neurobiology*, 84:105-115 (2008)).

Given the increase in the worldwide patient population afflicted by type 2 diabetes, there is a need for novel therapies which are effective with minimal adverse events. To decrease medical burden of type 2 diabetes through enhanced glycemic control, GPR40 modulator compounds of the present invention are being investigated
5 here for their incretin effect to promote GSIS as well as the potential combination with a broad range of anti-diabetic drugs.

The term "modulator" refers to a chemical compound with capacity to either enhance (*e.g.*, "agonist" activity) or partially enhance (*e.g.*, "partial agonist" activity) or inhibit (*e.g.*, "antagonist" activity or "inverse agonist" activity) a functional property of
10 biological activity or process (*e.g.*, enzyme activity or receptor binding); such enhancement or inhibition may be contingent on the occurrence of a specific event, such as activation of a signal transduction pathway, receptor internalization, and/or may be manifest only in particular cell types.

It is also desirable and preferable to find compounds with advantageous and
15 improved characteristics compared with known anti-diabetic agents, in one or more of the following categories that are given as examples, and are not intended to be limiting: (a) pharmacokinetic properties, including oral bioavailability, half life, and clearance; (b) pharmaceutical properties; (c) dosage requirements; (d) factors that decrease blood drug concentration peak-to-trough characteristics; (e) factors that increase the concentration of
20 active drug at the receptor; (f) factors that decrease the liability for clinical drug-drug interactions; (g) factors that decrease the potential for adverse side-effects, including selectivity versus other biological targets; and (h) improved therapeutic index with less propensity for hypoglycemia.

As used herein, the term "patient" encompasses all mammalian species.

25 As used herein, the term "subject" refers to any human or non-human organism that could potentially benefit from treatment with a GPR40 modulator. Exemplary subjects include human beings of any age with risk factors for metabolic disease. Common risk factors include, but are not limited to, age, sex, weight, family history, or signs of insulin resistance such as acanthosis nigricans, hypertension, dislipidemia, or
30 polycystic ovary syndrome (PCOS).

As used herein, "treating" or "treatment" cover the treatment of a disease-state in a mammal, particularly in a human, and include: (a) inhibiting the disease-state, *i.e.*,

arresting its development; (b) relieving the disease-state, *i.e.*, causing regression of the disease state; and/or (c) preventing the disease-state from occurring in a mammal, in particular, when such mammal is predisposed to the disease-state but has not yet been diagnosed as having it.

5 As used herein, "preventing" or "prevention" cover the preventive treatment (*i.e.*, prophylaxis and/or risk reduction) of a subclinical disease-state in a mammal, particularly in a human, aimed at reducing the probability of the occurrence of a clinical disease-state. Patients are selected for preventative therapy based on factors that are known to increase risk of suffering a clinical disease state compared to the general population.

10 "Prophylaxis" therapies can be divided into (a) primary prevention and (b) secondary prevention. Primary prevention is defined as treatment in a subject that has not yet presented with a clinical disease state, whereas secondary prevention is defined as preventing a second occurrence of the same or similar clinical disease state.

 As used herein, "risk reduction" covers therapies that lower the incidence of
15 development of a clinical disease state. As such, primary and secondary prevention therapies are examples of risk reduction.

 "Therapeutically effective amount" is intended to include an amount of a compound of the present invention that is effective when administered alone or in combination to modulate GPR40 and/or to prevent or treat the disorders listed herein.
20 When applied to a combination, the term refers to combined amounts of the active ingredients that result in the preventive or therapeutic effect, whether administered in combination, serially, or simultaneously.

In Vitro GPR40 Assays

25 FDSS-Based Intracellular Calcium Assay

 Cell lines expressing GPR40 are generated using the pDEST-3xFLAG gene expression system and are cultured in culture medium comprising the following components: F12 (Gibco #11765), 10% lipid deprived fetal bovine serum, 250 µg/ml zeocin and 500 µg/ml G418. To conduct the fluorescent imaging plate reader (FLIPR)-
30 based calcium flux assay to measure intracellular Ca²⁺ response, cells expressing GPR40 are plated on 384 well plates (BD Biocoat #356697) at a density of 20,000 cells/20 µL medium per well in phenol red and serum-free DMEM (Gibco #21063-029) and

incubated overnight. Using BD kit #s 80500-310 or -301, the cells are incubated with 20 μ L per well of Hank's buffered salt solution with 1.7 mM probenecid and Fluo-3 at 37 °C for 30 min. Compounds are dissolved in DMSO and diluted to desired concentrations with assay buffer and added to the cells as 3x solution (20 μ L per well). Run

The exemplified Examples disclosed below were tested in the Human GRP40 *In Vitro* assay described above and found having hGRP40 modulating activity.

GRP40 IP-One HTRF Assays in HEK293/GRP40 Inducible Cell Lines

10 Human, mouse and rat GRP40-mediated intracellular IP-One HTRF assays were established using human embryonic kidney HEK293 cells stably transfected with a tetracycline-inducible human, mouse or rat GRP40 receptor. Cells were routinely cultured in growth medium containing DMEM (Gibco Cat. #12430-047), 10% qualified FBS (Sigma, Cat. #F2442), 200 μ g/mL hygromycin (Invitrogen, Cat. #16087-010) and

15 1.5 μ g/mL blasticidin (Invitrogen, Cat. #R210-01). About 12-15 million cells were passed into a T175 tissue culture flask (BD Falcon 353112) with growth medium and incubated for 16-18 hours (overnight) at 37 °C with 5% CO_2 . The next day, assay medium was exchanged with growth medium containing 1000 ng/mL of tetracycline (Fluka Analytical, Cat. #87128) to induce GRP40 expression for 18-24 hours at 37 °C incubator

20 with 5% CO_2 . After induction, the cells were washed with PBS (Gibco, Cat. #14190-036) and detached with Cell Stripper (Cellgro, Cat. #25-056-CL). 10-20 mL growth medium were added to the flask and cells were collected in 50mL tubes (Falcon, Cat. #352098) and spun at 1000 RPM for 5 minutes. Culture medium was aspirated and the cells were resuspended in 10 mL of 1X IP-One Stimulation Buffer from the Cisbio IP-One kit

25 (Cisbio, Cat. #62IPAPEJ). The cells were diluted to 1.4×10^6 cells/mL in Stimulation Buffer.

Test compounds were 3-fold, 11-point serially diluted in DMSO in a REMP assay plate (Matrix Cat. #4307) by Biocel (Agilent). The compounds were transferred into an Echo plate (Labcyte, Cat. #LP-0200) and 20 nL of diluted compounds were transferred to

30 an assay plate (proxi-plate from Perkin Elmer, Cat. #6008289) by Echo acoustic nano dispenser (Labcyte, model ECHO550). 14 μ L of the diluted cells were then added to the assay plate by Thermo (SN 836 330) CombiDrop and incubated at room temperature for

45 minutes. Then 3 μ L of IP1 coupled to dye D2 from the Cisbio IP-One kit were added to the assay plate followed by 3 μ L of Lumi4-Tb cryptate K from the kit. The plate was further incubated at room for 1 hour before reading on the Envision (Perkin Elmer Model2101) with an HTRF protocol. Activation data for the test compound over a range of concentrations was plotted as percentage activation of the test compound (100% = maximum response). After correcting for background [(sample read-mean of low control) / (mean of high control - mean of low control)] (low control is DMSO without any compound), EC₅₀ values were determined. The EC₅₀ is defined as the concentration of test compound which produces 50% of the maximal response and was quantified using the 4 parameter logistic equation to fit the data. The maximal Y value observed (% Ymax) was calculated relative to a BMS standard reference compound at a final concentration of 0.625 μ M.

Some of the exemplified Examples disclosed below were tested in the Human GRP40 *In Vitro* assay described above and found having hGRP40 modulating activity reported as hGPR40 IP1 EC₅₀.

V. PHARMACEUTICAL COMPOSITIONS, FORMULATIONS AND COMBINATIONS

The compounds of this invention can be administered for any of the uses described herein by any suitable means, for example, orally, such as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixirs, tinctures, suspensions (including nanosuspensions, microsuspensions, spray-dried dispersions), syrups, and emulsions; sublingually; buccally; parenterally, such as by subcutaneous, intravenous, intramuscular, or intrasternal injection, or infusion techniques (e.g., as sterile injectable aqueous or non-aqueous solutions or suspensions); nasally, including administration to the nasal membranes, such as by inhalation spray; topically, such as in the form of a cream or ointment; or rectally such as in the form of suppositories. They can be administered alone, but generally will be administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

The term "pharmaceutical composition" means a composition comprising a compound of the invention in combination with at least one additional pharmaceutically acceptable carrier. A "pharmaceutically acceptable carrier" refers to media generally accepted in the art for the delivery of biologically active agents to animals, in particular,

mammals, including, *i.e.*, adjuvant, excipient or vehicle, such as diluents, preserving agents, fillers, flow regulating agents, disintegrating agents, wetting agents, emulsifying agents, suspending agents, sweetening agents, flavoring agents, perfuming agents, antibacterial agents, antifungal agents, lubricating agents and dispensing agents,
5 depending on the nature of the mode of administration and dosage forms.

Pharmaceutically acceptable carriers are formulated according to a number of factors well within the purview of those of ordinary skill in the art. These include, without limitation: the type and nature of the active agent being formulated; the subject to which the agent-containing composition is to be administered; the intended route of
10 administration of the composition; and the therapeutic indication being targeted.

Pharmaceutically acceptable carriers include both aqueous and non-aqueous liquid media, as well as a variety of solid and semi-solid dosage forms. Such carriers can include a number of different ingredients and additives in addition to the active agent, such additional ingredients being included in the formulation for a variety of reasons, *e.g.*,
15 stabilization of the active agent, binders, etc., well known to those of ordinary skill in the art. Descriptions of suitable pharmaceutically acceptable carriers, and factors involved in their selection, are found in a variety of readily available sources such as, for example, Allen, L.V., Jr. et al., *Remington: The Science and Practice of Pharmacy* (2 Volumes), 22nd Edition, Pharmaceutical Press (2012).

20 The dosage regimen for the compounds of the present invention will, of course, vary depending upon known factors, such as the pharmacodynamic characteristics of the particular agent and its mode and route of administration; the species, age, sex, health, medical condition, and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment; the frequency of treatment; the route of administration, the
25 renal and hepatic function of the patient, and the effect desired.

By way of general guidance, the daily oral dosage of each active ingredient, when used for the indicated effects, will range between about 0.001 to about 5000 mg per day, preferably between about 0.01 to about 1000 mg per day, and most preferably between about 0.1 to about 250 mg per day. Intravenously, the most preferred doses will range
30 from about 0.01 to about 10 mg/kg/minute during a constant rate infusion. Compounds of this invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three, or four times daily.

The compounds are typically administered in admixture with suitable pharmaceutical diluents, excipients, or carriers (collectively referred to herein as pharmaceutical carriers) suitably selected with respect to the intended form of administration, *e.g.*, oral tablets, capsules, elixirs, and syrups, and consistent with conventional pharmaceutical practices.

Dosage forms (pharmaceutical compositions) suitable for administration may contain from about 1 milligram to about 2000 milligrams of active ingredient per dosage unit. In these pharmaceutical compositions the active ingredient will ordinarily be present in an amount of about 0.1-95% by weight based on the total weight of the composition.

A typical capsule for oral administration contains at least one of the compounds of the present invention (250 mg), lactose (75 mg), and magnesium stearate (15 mg). The mixture is passed through a 60 mesh sieve and packed into a No. 1 gelatin capsule.

A typical injectable preparation is produced by aseptically placing at least one of the compounds of the present invention (250 mg) into a vial, aseptically freeze-drying and sealing. For use, the contents of the vial are mixed with 2 mL of physiological saline, to produce an injectable preparation.

The present invention includes within its scope pharmaceutical compositions comprising, as an active ingredient, a therapeutically effective amount of at least one of the compounds of the present invention, alone or in combination with a pharmaceutical carrier. Optionally, compounds of the present invention can be used alone, in combination with other compounds of the invention, or in combination with one or more other therapeutic agent(s), *e.g.*, an antidiabetic agent or other pharmaceutically active material.

The compounds of the present invention may be employed in combination with other GPR40 modulators or one or more other suitable therapeutic agents useful in the treatment of the aforementioned disorders including: anti-diabetic agents, anti-hyperglycemic agents, anti-hyperinsulinemic agents, anti-retinopathic agents, anti-neuropathic agents, anti-nephropathic agents, anti-atherosclerotic agents, anti-ischemic agents, anti-hypertensive agents, anti-obesity agents, anti-dyslipidemic agents, anti-hyperlipidemic agents, anti-hypertriglyceridemic agents, anti-hypercholesterolemic

Med. Chem.*, 55(9):4511-4515 (2012)), sodium-glucose transporter-2 (SGLT2) inhibitors (for example dapagliflozin, canagliflozin, empagliflozin, remagliflozin), 11 β -HSD-1 inhibitors (for example MK-0736, BI35585, BMS-823778, and LY2523199), MGAT inhibitors (for example, as described in Barlind, J. G. et al., *Bioorg. Med. Chem. Lett.* (2013), doi: 10.1016/j.bmcl.2013.02.084), amylin analogs such as pramlintide, and/or insulin. Reviews of current and emerging therapies for the treatment of diabetes can be found in: Mohler, M.L. et al., *Medicinal Research Reviews*, 29(1):125-195 (2009), and Mizuno, C.S. et al., *Current Medicinal Chemistry*, 15:61-74 (2008).

The GPR40 receptor modulator of formula I may also be optionally employed in combination with agents for treating complication of diabetes. These agents include PKC inhibitors and/or AGE inhibitors.

5 The GPR40 receptor modulator of formula I may also be optionally employed in combination with one or more hypophagic agents such as diethylpropion, phendimetrazine, phentermine, orlistat, sibutramine, lorcaserin, pramlintide, topiramate, MCHR1 receptor antagonists, oxyntomodulin, naltrexone, Amylin peptide, NPY Y5 receptor modulators, NPY Y2 receptor modulators, NPY Y4 receptor modulators, cetilistat, 5HT2c receptor modulators, and the like. The compound of structure I may
10 also be employed in combination with an agonist of the glucagon-like peptide-1 receptor (GLP-1 R), such as exenatide, liraglutide, GPR-1(1-36) amide, GLP-1(7-36) amide, GLP-1(7-37) (as disclosed in U.S. Patent No. 5,614,492 to Habener, the disclosure of which is incorporated herein by reference), which may be administered via injection, intranasal, or by transdermal or buccal devices. Reviews of current and emerging therapies for the
15 treatment of obesity can be found in: Melnikova, I. et al., *Nature Reviews Drug Discovery*, 5:369-370 (2006); Jones, D., *Nature Reviews: Drug Discovery*, 8:833-834 (2009); Obici, S., *Endocrinology*, 150(6):2512-2517 (2009); and Elangbam, C.S., *Vet. Pathol.*, 46(1):10-24 (2009).

The above other therapeutic agents, when employed in combination with the
20 compounds of the present invention may be used, for example, in those amounts indicated in the *Physicians' Desk Reference*, as in the patents set out above, or as otherwise determined by one of ordinary skill in the art.

Particularly when provided as a single dosage unit, the potential exists for a chemical interaction between the combined active ingredients. For this reason, when the
25 compound of the present invention and a second therapeutic agent are combined in a single dosage unit they are formulated such that although the active ingredients are combined in a single dosage unit, the physical contact between the active ingredients is minimized (that is, reduced). For example, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the
30 contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the gastrointestinal tract such that one of these components is not released in the stomach but rather is released in the intestines. One of

the active ingredients may also be coated with a material that affects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients. Furthermore, the sustained-released component can be additionally enteric coated such that the release of this component occurs only in the intestine. Still another approach would involve the formulation of a combination product in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a low viscosity grade of hydroxypropyl methylcellulose (HPMC) or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to form an additional barrier to interaction with the other component.

These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time by the same manner, will be readily apparent to those skilled in the art, once armed with the present disclosure.

The compounds of the present invention can be administered alone or in combination with one or more additional therapeutic agents. By "administered in combination" or "combination therapy" it is meant that the compound of the present invention and one or more additional therapeutic agents are administered concurrently to the mammal being treated. When administered in combination, each component may be administered at the same time or sequentially in any order at different points in time. Thus, each component may be administered separately but sufficiently closely in time so as to provide the desired therapeutic effect.

The compounds of the present invention are also useful as standard or reference compounds, for example as a quality standard or control, in tests or assays involving the GPR40 receptor. Such compounds may be provided in a commercial kit, for example, for use in pharmaceutical research involving GPR40 or anti-diabetic activity. For example, a compound of the present invention could be used as a reference in an assay to compare its known activity to a compound with an unknown activity. This would ensure the experimenter that the assay was being performed properly and provide a basis for comparison, especially if the test compound was a derivative of the reference compound. When developing new assays or protocols, compounds according to the present invention could be used to test their effectiveness.

The compounds of the present invention may also be used in diagnostic assays involving GPR40.

The present invention also encompasses an article of manufacture. As used herein, article of manufacture is intended to include, but not be limited to, kits and packages. The article of manufacture of the present invention, comprises: (a) a first container; (b) a pharmaceutical composition located within the first container, wherein the composition, comprises: a first therapeutic agent, comprising a compound of the present invention or a pharmaceutically acceptable salt form thereof; and, (c) a package insert stating that the pharmaceutical composition can be used for the treatment of multiple diseases or disorders associated with GPR40 (as defined previously). In another embodiment, the package insert states that the pharmaceutical composition can be used in combination (as defined previously) with a second therapeutic agent for the treatment of multiple diseases or disorders associated with GPR40. The article of manufacture can further comprise: (d) a second container, wherein components (a) and (b) are located within the second container and component (c) is located within or outside of the second container. Located within the first and second containers means that the respective container holds the item within its boundaries.

The first container is a receptacle used to hold a pharmaceutical composition. This container can be for manufacturing, storing, shipping, and/or individual/bulk selling. First container is intended to cover a bottle, jar, vial, flask, syringe, tube (*e.g.*, for a cream preparation), or any other container used to manufacture, hold, store, or distribute a pharmaceutical product.

The second container is one used to hold the first container and, optionally, the package insert. Examples of the second container include, but are not limited to, boxes (*e.g.*, cardboard or plastic), crates, cartons, bags (*e.g.*, paper or plastic bags), pouches, and sacks. The package insert can be physically attached to the outside of the first container via tape, glue, staple, or another method of attachment, or it can rest inside the second container without any physical means of attachment to the first container. Alternatively, the package insert is located on the outside of the second container. When located on the outside of the second container, it is preferable that the package insert is physically attached via tape, glue, staple, or another method of attachment. Alternatively, it can be

adjacent to or touching the outside of the second container without being physically attached.

The package insert is a label, tag, marker, etc. that recites information relating to the pharmaceutical composition located within the first container. The information
5 recited will usually be determined by the regulatory agency governing the area in which the article of manufacture is to be sold (*e.g.*, the United States Food and Drug Administration). Preferably, the package insert specifically recites the indications for which the pharmaceutical composition has been approved. The package insert may be made of any material on which a person can read information contained therein or
10 thereon. Preferably, the package insert is a printable material (*e.g.*, paper, plastic, cardboard, foil, adhesive-backed paper or plastic, etc.) on which the desired information has been formed (*e.g.*, printed or applied).

Other features of the invention will become apparent in the course of the following descriptions of exemplary embodiments that are given for illustration of the
15 invention and are not intended to be limiting thereof.

The organic solution was washed with water (2x), dried (MgSO₄), and concentrated. The crude material was used directly in the next step without further purification. To a solution of (*R*)-methyl 3-((*tert*-butyldimethylsilyl)oxy)-3,4-dihydro-2*H*-pyrrole-5-carboxylate in CH₂Cl₂ (101 mL) at -10 °C was added 2,6-lutidine (11.8 mL, 101 mmol) followed by the dropwise addition of benzyl chloroformate (7.9 mL, 56 mmol) and the reaction mixture was warmed to rt and stirred overnight. Ethylenediamine (0.50 mL, 7.4 mmol) was added to the reaction mixture, which was stirred for 15 min at rt and then washed with 1 N aq. citric acid (60 mL) and 1 N aq. HCl (50 mL). The organic layer was washed with water, 1.5 N aq. KH₂PO₄, and brine. The organic layer was dried (Na₂SO₄), filtered, and concentrated.
