

## **1,5-DIPHENYL-PENTA-1,4-DIEN-3-ONE COMPOUNDS**

### **CROSS REFERENCE TO RELATED APPLICATIONS**

This application claims priority to U.S. Provisional Application Serial No. 61/375,534, filed August 20, 2010. The contents of the prior application are hereby  
5 incorporated by reference in their entirety.

### **BACKGROUND**

Signal Transducer and Activator of Transcription (STAT) proteins are transcription factors that mediate cellular responses to growth factors. These proteins are activated via tyrosine phosphorylation by growth factor receptor-associated tyrosine  
10 kinases. Activated STAT proteins promote cell survival and proliferation. It is now well established that persistent activation of STAT3 or STAT5 promotes cell growth, invasion, and metastasis of both solid and hematopoietic cancers. See, e.g., Expert Opin. Investig. Drugs, 2009, 18(1): 45-56.

In normal lymphoid cells, STAT proteins, e.g., STAT3, also mediate cellular  
15 responses to cytokines, such as interleukin-6 (IL-6), via cytokine receptor-associated Janus kinases (JAKs). See, e.g., Neoplasia 2008, 10: 287-297. IL-6 is abnormally elevated in patients suffering from hematopoietic cancers, inflammatory diseases, autoimmune diseases, and postmenopausal osteoporosis. Inhibiting cellular action of IL-6, e.g., by inducing STAT3 proteins degradation, has attributed to treatment of these  
20 diseases.

As such, compounds that deactivate STAT proteins can be used to treat various cancers, inflammatory diseases, and autoimmune diseases.

### **SUMMARY**

This invention is based on a discovery that a group of compounds having a  
25 backbone of 1,5-diphenyl-penta-1,4-dien-3-one deactivate STAT proteins.

One aspect of this invention relates to a compound of Formula (I):

### DETAILED DESCRIPTION

The compounds described above can be prepared by methods well known in the art. Schemes 1, 2, and 3 below demonstrate general synthetic routes used to synthesize compounds of formulas (I), (II), and (III), respectively.

5

#### Scheme 1

As shown in Scheme 1 above, benzaldehyde is condensed with excessive acetone under a basic condition to give a 4-phenylbut-3-en-2-one compound, which is condensed with a second benzaldehyde compound to afford compounds of Formula (I). The thus-obtained product can be further modified to prepare other compounds of Formula (I).

#### Scheme 2

15

As shown in Scheme 2 above, hydroxyl-substituted 1,5-diphenylpenta-1,4-dien-3-one compounds (which can be prepared by the method described above) are condensed with sulfonyl chloride or chlorophosphine/phosphorochloridate/phosphoryl trichloride or acyl chloride to give compounds of Formula (II). Similarly, 3,5-dibenzylidenepiperidin-

20

4-one compounds can be condensed with sulphonyl chloride/chlorophosphine/acetyl chloride to give compounds also covered by Formula (II).

**Scheme 3**

5

As shown in Scheme 3 above, piperidin-4-one is reacted with acyl chloride or bromoalkane to give N-substituted piperidin-4-one, which is subsequently condensed with 2 equivalents of benzaldehyde to afford symmetric 3,5-dibenzylidenepiperidin-4-one compounds covered by Formula (III). The N-substituted piperidin-4-one can be first  
 10 reacted with 1 equivalent of benzaldehyde, and then with 1 equivalent of second benzaldehyde to prepare asymmetric 3,5-dibenzylidenepiperidin-4-one compounds, which are also covered by Formula (III).

Shown below are exemplary compounds of Formula (I), (II), and (III) prepared by  
 15 the above-described methods:

The compounds described above deactivate STAT proteins. Thus, this invention covers a method of administering an effective amount of one or more of the compounds to a patient having cancer, inflammatory disease, or autoimmune disease.

The term “treating” or “treatment” refers to administering one or more compounds to a subject, who has an above-described condition, a symptom of such a condition, or a predisposition toward such a condition, with the purpose to confer a therapeutic effect, e.g., to cure, relieve, alter, affect, ameliorate, or prevent the above-described disorder, the symptom of it, or the predisposition toward it. “An effective amount” refers to the amount of an active compound that is required to confer a therapeutic effect on the treated subject. Effective doses will vary, as recognized by those skilled in the art, depending on the types of diseases treated, route of administration, excipient usage, and the possibility of co-usage with other therapeutic treatment.

Cancers that can be treated by the method of the invention include both solid and haematological tumors of various organs. Examples of solid tumors include pancreatic cancer, bladder cancer, colon cancer, colorectal cancer, breast cancer (e.g., metastatic breast cancer), prostate cancer (e.g., androgen-dependent, androgen-independent, or castrate-resistant prostate cancer), renal cancer (e.g., metastatic renal cell carcinoma), hepatocellular cancer, lung cancer (e.g., non-small cell lung cancer, bronchioloalveolar carcinoma, or adenocarcinoma of the lung), ovarian cancer (e.g., progressive epithelial or primary peritoneal cancer), cervical cancer, gastric cancer, esophageal cancer, head and neck cancer (e.g., squamous cell carcinoma of the head and neck), melanoma, neuroendocrine cancer (e.g., metastatic neuroendocrine tumors), brain tumors (e.g., glioma, anaplastic oligodendroglioma, adult glioblastoma multiforme, or adult anaplastic astrocytoma), bone cancer, and soft tissue sarcoma. Examples of haematological tumors include various leukemia (e.g., myeloid leukemia, chronic myelogenous leukemia or CML [accelerated CML and CML blast phase], acute lymphoblastic leukemia, or chronic lymphocytic leukemia), Hodgkin's disease, non-Hodgkin's lymphoma (e.g., follicular lymphoma or mantle cell lymphoma), B-cell lymphoma, T-cell lymphoma, multiple myeloma, Waldenstrom's macroglobulinemia, myelodysplastic syndromes (e.g., refractory anemia, refractory anemia with ringed siderblasts, refractory anemia with excess blasts or RAEB, or RAEB in transformation), and myeloproliferative syndromes.

Inflammatory diseases that can be treated by the method of this invention include, but are not limited to, asthma, atherosclerosis, rheumatoid arthritis, inflammatory bowel diseases, Crohn, ulcerative colitis, ischemic heart disease, cardiomyopathy, glomerulonephritis, nephritic syndrome, hepatitis B or C infection, respiratory syncytial virus infection (pulmonary), and Guillain-Barré syndrome.

Autoimmune diseases that can be treated by the method of this invention include, but are not limited to, allergic encephalopathy, chronic obstructive pulmonary disease, psoriasis, psoriatic arthritis, diabetes mellitus, systemic lupus erythematosus, multiple sclerosis, polymyositis, dermatomyositis, mixed connective tissue disease, Sjögren's syndrome, Wegener's granulomatosis, polyarteritis nodosa, rheumatoid arthritis, and idiopathic thrombocytopenic purpura.

To practice the method of the present invention, a composition having one or more of the above-described compounds can be administered parenterally, orally, nasally, rectally, topically, or buccally. The term "parenteral" as used herein refers to subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intraarterial, intrasynovial, intrasternal, intrathecal, intralesional, or intracranial injection, as well as any suitable infusion technique.

A sterile injectable composition can be a solution or suspension in a non-toxic parenterally acceptable diluent or solvent, such as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that can be employed are mannitol, water, Ringer's solution, and isotonic sodium chloride solution. In addition, fixed oils are conventionally employed as a solvent or suspending medium (e.g., synthetic mono- or diglycerides). Fatty acid, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions can also contain a long chain alcohol diluent or dispersant, carboxymethyl cellulose, or similar dispersing agents. Other commonly used surfactants such as Tweens or Spans or other similar emulsifying agents or bioavailability enhancers which are commonly used in the

manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms can also be used for the purpose of formulation.

A composition for oral administration can be any orally acceptable dosage form including capsules, tablets, emulsions and aqueous suspensions, dispersions, and solutions. In the case of tablets, commonly used carriers include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions or emulsions are administered orally, the active ingredient can be suspended or dissolved in an oily phase combined with emulsifying or suspending agents. If desired, certain sweetening, flavoring, or coloring agents can be added.

A nasal aerosol or inhalation composition can be prepared according to techniques well known in the art of pharmaceutical formulation. For example, such a composition can be prepared as a solution in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

A composition having one or more active compounds can also be administered in the form of suppositories for rectal administration.

The carrier in the pharmaceutical composition must be "acceptable" in the sense that it is compatible with the active ingredient of the composition (and preferably, capable of stabilizing the active ingredient) and not deleterious to the subject to be treated. One or more solubilizing agents can be utilized as pharmaceutical excipients for delivery of an active 1,5-diphenyl-penta-1,4-dien-3-one compound. Examples of other carriers include colloidal silicon oxide, magnesium stearate, cellulose, sodium lauryl sulfate, and D&C Yellow # 10.

The 1,5-diphenyl-penta-1,4-dien-3-one compounds described above can be preliminarily screened for their efficacy in deactivating STAT proteins and treating above-described diseases by an *in vitro* assay and then confirmed by animal experiments and clinic trials. Other methods will also be apparent to those of ordinary skill in the art.

The specific examples below are to be construed as merely illustrative, and not limitative of the remainder of the disclosure in any way whatsoever. Without further elaboration, it is believed that one skilled in the art can, based on the description herein, utilize the present invention to its fullest extent. All publications cited herein are hereby

### CHEMICAL SYNTHESSES

Melting points were determined using a Fisher-John melting point apparatus without calibration. Proton Nuclear Magnetic Resonance ( $^1\text{H}$  NMR) and  $^{13}\text{C}$  NMR  
10 spectra were measured on Varian Gemini 300 or Inova 400 spectrometers with tetramethylsilane as the internal standard. Chemical shifts were reported in  $\delta$  (ppm). Mass spectra (MS) were obtained on a Shimadzu LCMS-2010. A CombiFlash chromatographic system was performed over Grace silica gel cartridge for general separation and purification. Preparative thin layer chromatography using silica gel plates  
15 (Kieselgel 60, F254, 1.00 mm) were also used for separation and purification. Precoated silica gel plates (Kieselgel 60, F254, 0.25mm) were used for thin layer chromatography (TLC) analysis. All reagents and solvents were purchased from Aldrich, Fisher, VWR, or other vendors.

#### Synthesis of Compounds 1-4 and 21

  
20

Compounds 1-4 and 21 were prepared as shown in Scheme 4 below:

Attorney's Docket No.: 60015-005001

Scheme 4

To a solution of hydroxyl benzaldehyde in DMF was added  $K_2CO_3$  (2 eq. each hydroxyl group) at 4°C in an ice-bath and methyl chloromethyl ether (MOM chloride) (1.3 eq. each hydroxyl group). After the solution was stirred at room temperature and monitored by TLC for 3-5 hours, hexanes/dichloromethane (1:1) was added and allowed to stir for 30 min. The solid was filtered out and the filtrate was concentrated. The resulting residue was diluted with EtOAc and washed with  $H_2O$  twice. The aqueous layer was extracted with EtOAc. The combined organic layers were dried over  $Na_2SO_4$  and concentrated. The crude was purified by a CombiFlash chromatography system using a Grace silica gel column and hexanes/ethyl acetate (as the eluent) to give MOM protected hydroxylbenzaldehyde. The resulting compound further reacted with excess acetone in ethanol catalyzed by 10% NaOH (1.2 eq. of NaOH). After stirred at room temperature and monitored by TLC for 1-5 hours, the reaction mixture was diluted with  $CH_2Cl_2$ , washed with  $H_2O$  twice, and extracted with  $CH_2Cl_2$  twice. The MOM protected hydroxy-phenyl-but-3-en-2-one was obtained after purification by a ConmbiFlash system using hexanes/ethyl acetate as the eluent. The resulting compound reacted with an appropriate MOM protected hydroxybenzaldehyde to afford MOM protected hydroxyl 1,5-diphenyl-penta-1,4-dien-3-one, which was deprotected by heating in 50% acetic acid aqueous solution to afford the desired product.

### Syntheses of Compounds 12, 13, and 15-17

- 5 Compounds 12, 13, and 15-17 were synthesized as shown in Scheme 6, by methods modified based on that described in Roberta Costi, et al., *Bioorganic & Medicinal Chemistry* 2004, 12: 199-215.

**Scheme 6**

To a solution of piperidin-4-one in DMF was added triethylamine (1.5 eq.) and *N,N*-diethylacetamide chloride (1.5 eq.). The resulting solution was stirred at room temperature for 5 hours or until completion observed by TLC. The solvent was evaporated and the residue was partitioned in  $\text{H}_2\text{O}$  and EtOAc. The aqueous layer was

extracted with EtOAc and the combined organic layers were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated. The crude product was purified by a CombiFlash chromatography system using silica gel cartridge and CH<sub>2</sub>Cl<sub>2</sub>/MeOH gradient eluent to afford 4-oxo-piperidine-1-carboxylic acid diethylamide, which was subsequently reacted with 3-

5 hydroxybenzaldehyde (2.5 eq.) in acetic acid (99.7%) and purged with HCl gas (0.5-1 h). After stirring at room temperature for 3 hours, the solvent was evaporated and the crude was purified by a Combiflash chromatography system with hexanes/EtOAc as eluent, followed by crystallization from MeOH, to afford Compound 12 as a yellow crystalline solid.

#### Inhibitory effects on proliferation of human Lennert's T cell lymphoma KT-3

Inhibitory effects of compounds of this invention on the growth of human Lennert's T cell lymphoma KT-3 cells, an IL-6-dependent cell line, were determined as described below. Briefly, KT-3 cells were transferred into wells of 96-well plates (2.5 × 10<sup>3</sup>/well) and cultured in RPMI-1640 medium (GIBCO) containing penicillin (25 U/ml), streptomycin (25 µg/ml), 10% heat-inactivated fetal bovine serum (FBS), and hIL-6

(2.5 ng/ml, R&D systems). To experimental wells, test compounds at various concentrations (in triplicates) were added immediately after the cells were plated. To the control wells, an equal volume of vehicle, DMSO (0.1 % v/v), was added. After incubating the cells with the compounds or in vehicle for 48 hours, cell viability was assessed using a CellTiter Glo Luminescent Cell Viability Assay Kit (Promega, Madison, WI). The resultant luminescence was quantified using Microplate Luminometer LB96V (EG&G BERTH HOLD) according to the manufacturer's protocol. The cell surviving rate was calculated by dividing the luminescence value of compound-treated cells with that of vehicle-treated cells.

All of Compounds 1-79 exhibited inhibitory effect on IL-6-induced KT-3 cell proliferation. Some compounds, i.e., Compounds 6, 16, 18, 19, 26, 27, 35, 36, 45-51, 56, 57 and 79 unexpectedly had IC<sub>50</sub> values (the concentration at which a compound suppresses cell growth by 50%) equal to or even lower than 0.05  $\mu$ M. In addition, all compounds 1-79 inhibited KT-3 cell proliferation in a dose-dependent manner.

#### Inhibition of growth of various human tumor cell lines

The inhibitory effects of Compound 6 were determined as described below on the growth of colon cancer cells (HCT116, HT29, SW480, and SW620), colon adenocarcinoma cells (Colo205), prostate adenocarcinoma cells (PC-3 and Du145), prostate carcinoma cells (CWR22RV and LNCap), non-small cell lung carcinoma cells (NCI-H1299), lung adenocarcinoma cells (A549), large cell lung carcinoma cells (NCI-H460), breast metastatic carcinoma cells (MDA-MB-453), breast ductal carcinoma cells (T-47D), breast adenocarcinoma cells (MCF7), hepatocellular carcinoma cells (Huh-7 and HepG2), pancreatic carcinoma cells (PANC-1), cervix adenocarcinoma cells (Hela), IL-6-dependent Lennert's T-cell lymphoma cells (KT-3), IL-6-dependent multiple myeloma cells (INA-6), multiple myeloma cells (KMM-1 and U266), myeloid leukemia cells (HL-60), and T-cell leukemia cells (Jurkat). Briefly, tumor cells were seeded at densities ranging from  $1 \times 10^3$  to  $4 \times 10^3$ /well in 96-well Microtest III tissue culture plates (Falcon,

NJ). After cultured in DMEM (GIBCO) containing penicillin (25 units/milliliter), streptomycin (25 micrograms/milliliter), and 10% heat-inactivated FBS for 12 hours, cells were treated with various concentrations ranging from 0 to 5  $\mu$ M of compound 6 for 72 h. The viability of the tumor cells was then assessed using the tetrazolium-based calorimetric assay (MTT) as described in Su et al., J Mol Cell Cardiol. 1998; 30:587-598. The cells were incubated with the MTT dye (5 mg/mL) at 37°C for 3 hours. The resultant formazan crystals were solubilized with MTT lysis buffer (50% DMF, 24 mM HCl, 2% Acetic Acid, 5% SDS) and the absorbance at 595 nm was measured using a Benchmark microplate reader (BIO-RAD, Hercules, CA). The cells surviving rate was calculated by the absorbance value of compound-treated cells vs. that of vehicle-treated cells.

Compound 6 exhibited dose-dependent inhibitory effects on the growth of all tumor cells tested and with IC<sub>50</sub> values ranging from 0.02 to 5.5  $\mu$ M.

#### Western Blot analysis of MRG, STAT1, STAT3, and STAT5 proteins in KT-3 cells

Western Blot analysis was performed as described in Kawashima et al., J. Immunol. 2001, 167:3652-3660, with minor modifications. Briefly, KT-3 cells were treated with 1, 5, or 20  $\mu$ M of compound 6 or vehicle alone in the above described IL-6-containing medium. At various time points after incubation (i.e., 0.5, 1, 3, and 6 hours after the treatment), cells were harvested and lysed using a lysis buffer (1.0 % Triton X-100, 50 mM Tris-HCl (pH 7.5), 0.1 mM EDTA, 150 mM NaCl, 200  $\mu$ M Na<sub>3</sub>VO<sub>4</sub>, 50 mM NaF, 1 mM dithiothreitol, 0.4 mM phenylmethylsulfonyl fluoride, 3  $\mu$ g/ml of aprotinin, 2  $\mu$ g/ml of pepstatin A, 1  $\mu$ g/ml of leupeptin) at  $2 \times 10^7$  cells/ml on ice for 30 min. Cell lysates were harvested by centrifugation at 12,000xg for 15 min. The samples ( $1 \times 10^5$  cell equivalent/lane) were subjected to sodium dodecyl sulfate-polyacrylamide gel electrophoresis and subsequently transferred onto Immobilon filters (Millipore). After blocked with 5 % BSA, the filter was probed with anti-pSTAT3, STAT3, STAT5, STAT1, MRG or Actin Abs. The rabbit polyclonal anti-STAT3, anti-STAT5, anti-STAT1, and anti-Actin antibodies (Abs), and mouse monoclonal anti-pSTAT3 Ab (B-7)

were obtained from Santa Cruz Biotechnology. Affinity purified anti-MRG Ab was prepared as described previously in Hirose et al., J. Biol. Chem. 276:5821-5828. The filter was further incubated with HRP-conjugated secondary antibodies. Finally, the proteins were visualized using the Enhanced Chemiluminescence (ECL) system (Amersham).

The results show that Compound 6 down-regulated MRG (MgcRacGAP, an evolutionarily conserved GTPase- activating) protein, STAT3, and STAT5 proteins and inhibited phosphorylation of STAT3 protein in KT-3 cells in a time and dose-dependent manner. In contrast, this compound had no effect on the expression of STAT1 in the KT3 cells under the testing condition.

#### Inhibitory effect on human colon cancer (HCT-116) in a mouse xenograft model

The in vivo experiments were carried out under an Institutional Animal Care and Use Committee-approved protocol and followed Institutional guidelines for proper and humane use of animals in research. Six-week-old female athymic nude mice were purchased from the Harlan Laboratory. Each of eight mice was injected subcutaneously with  $1 \times 10^6$  HCT-116 cells mixed with Matrigel (BD Bioscience) at the left flank. After injection, tumors were allowed to grow for 5 days into a palpable size (volume  $\sim 100 \text{ mm}^3$ ) before treatment. Mice were randomized into two groups ( $n=4$  per group). The control group was injected with a vehicle solution only (i.e., 10% DMSO and 90% corn oil), while the experimental group received a daily injection (i.p.) of compound 6 (at a dose of 40 mg/kg body weight, dissolved in the vehicle solution) from days 0 (the initiation day of injection) to 4 and from days 7 to 10. The sizes of tumors were measured twice a week using a Vernier caliper and calculated using the following formula: length x width x height x 0.5236, as described in Rockwell et al., J Natl. Cancer Inst. 1972; 49:735–747.

The result shows that Compound 6 inhibited human colon cancer growth in the xenograft mouse model.
