(54) Title: A COMMUNICATION SYSTEM, MOBILE DEVICE THEREFOR AND METHODS OF STORING PAGES ON A MOBILE DEVICE

(57) Abstract: A mobile telephone (1) is provided with an additional plug-in on its SIM card (2a), in the form of a domestic browser (12) with a domestic site (14). When a mobile user wants to access a page, such as an internet page on his telephone, the domestic browser searches a first file in a domestic site (14a) for the page identifier to see if the page is immediately accessible. If it is, then it retrieves the data from a second file in the domestic site another memory (14b) and' executes it for display. On the other hand, if the page identifier cannot be located in the domestic site (14a), the domestic browser (12) simply returns a negative result, at which point the SIM browser (10) on the SIM card (2a) has the page request transmitted to have the page retrieved from the Internet. The user of the mobile telephone (1) does not determine whether any page is to be saved in the domestic site (14), instead it is determined by the mobile operator or the page writer, by use of codes written into the WML page contents. The operator can also transmit push pages onto the mobile telephone (1) and have them saved, updated or deleted in the domestic site (14) without any user intervention.
