

TRANSMITTER, TRANSMISSION METHOD, RECEIVER, AND  
RECEPTION METHOD

ABSTRACT

5       An association with a system timing at the time of  
transmission is secured without changing a display timing  
in text information of a subtitle, and a reception side  
displays the subtitle at an appropriate timing.

      A packet in which a document of the text  
10   information of the subtitle having display timing  
information is included in a payload is generated and  
transmitted in synchronization with a sample period. A  
header of the packet includes a time stamp on a first  
time axis indicating a start time of the corresponding  
15   sample period. The payload of the packet further  
includes reference time information of a second time axis  
regarding the display timing associated with the start  
time of the corresponding sample period.
