(54) Title: ORDER CENTRIC TRACKING SYSTEM

(57) Abstract: A computerized order centric method and system (100) for tracking orders implemented on a trading floor exchange. The system automatically routes orders to a booth (110) and a floor broker according to a symbol associated with the particular security being traded. The method for processing an order for a security on the floor of an exchange includes representing a security with a symbol and allocating a set of symbols to a booth. In addition a set of symbols is allocated to a floor broker ID. An order, relating to a symbol is entered into a computer (116) and transmitted to a computer server (113). The order is routed through the server to a computerized booth station (161) associated with the booth to which the order symbol had been allocated. Typically the floor broker ID is logged into a computerized handled device (114-116).
