

ABSTRACT

EXTENSIONS TO DESIGN TOOL WITH MULTI-EDIT FUNCTION INCLUDING ALIGNMENT

Computer-implemented design tool functions are described herein for automatically performing edits across different portions of one or more design layouts. A method for the tool includes aligning elements outside of frames together with multiple elements selected within frames. Another method includes modifying visual characteristics of multiple elements based on a determined primary element of the multiple elements. Another method includes modifying matching properties of multiple elements based on a determined primary element of the multiple elements. Another method includes copying and pasting multiple elements from a first set of frames into a second set of frames. Another method includes modifying constraints of multiple elements based on a determined primary element of the multiple elements.
