

NOVEL TRPV3 MODULATORS

TECHNICAL FIELD

Compounds that are Transient Receptor Potential Vanilloid 3 (TRPV3) modulators, compositions comprising such compounds, and methods for treating conditions and disorders using such compounds and compositions, are disclosed herein.

BACKGROUND OF THE INVENTION

A subset of the vanilloid channels (TRPV1-4) are referred to as thermoTRPs to reflect the observation that heat elicits channel opening across a continuum of temperatures with thresholds ranging from 25°C to 52°C (Caterina, M.J.; Rosen, T.A.; Tominaga, M.; Brake, A.J.; Julius, D., *Nature* **1999**, 398, 436-441). TRPV3 characteristically responds to innocuous heat >31°C, exhibits exquisite sensitivity around the physiological temperature of humans, 37°C, and sensitizes dramatically following repetitive heating (Smith, G.D.; Gunthorpe, M.J.; Kelsell, R.E.; Hayes, P.D.; Reilly, P.; Facer, P.; Wright, J.E.; Jerman, J.C.; Walhin, J.P.; Ooi, L.; Egerton, J.; Charles, K.J.; Smart, D.; Randall, A.D.; Anand, P.; Davis, J.B., *Nature* **2002**, 418, 186-190.; Xu, H.; Ramsey, I.S.; Kotecha, S.A.; Moran, M.M.; Chong, J.A.; Lawson, D.; Ge, P.; Lilly, J.; Silos-Santiago, I.; Xie, Y.; DiStefano, P.S.; Curtis, R.; Clapham, D.E., *Nature* **2002**, 418, 181-186; Peier, A.M.; Reeve, A.J.; Andersson, D.A.; Moqrich, A.; Earley, T.J.; Hergarden, A.C.; Story, G.M.; Colley, S.; Hogenesch, J.B.; McIntyre, P.; Bevan, S.; Patapoutian, A., *Science* **2002**, 296, 2046-2049).

TRPV3 is a nonselective cation channel with permeability for calcium, but also to other cations, for example sodium. Multiple compounds that have been shown to activate TRPV3, include: monoterpenes, camphor (Peier, A.M. *et al.*, **2002**; Moqrich, A.; Hwang, S.W.; Earley, T.J.; Petrus, M.J.; Murray, A.N.; Spencer, K.S.; Andahazy, M.; Story, G.M.; Patapoutian, A., *Science* **2005**, 307, 1468-1472; Xu, H.; Blair, N.T.; Clapham, D.E., *J Neurosci.* **2005**, 25, 8924-8937), carvacrol, and thymol (Xu, H.; Delling, M.; Jun, J.C.; Clapham, D.E. *Nat Neurosci.* **2006**, 9, 628-635; Vogt-Eisele, A.K.; Weber, K.; Sherkheli, M.A.; Vielhaber, G.; Panten, J.; Gisselmann, G.; Hatt, H., *Br J Pharmacol.* **2007**, 151, 530-540; Earley, S.; Gonzales, A.L.; Garcia, Z.I., *Mol Pharmacol.* **2010**, Jan 19. [Epub ahead of print]); menthol (Macpherson, L.J.; Hwang, S.W.; Miyamoto, T.; Dubin, A.E.; Patapoutian,

A; Story, G.M., *Mol Cell Neurosci.* **2006**, 32, 335-343; Vogt-Eisele, A.K. *et al.*, **2007**); cinnamaldehyde (Macpherson, L.J. *et al.*, **2006**); incensole acetate (Moussaieff, A.; Rimmerman, N.; Bregman, T.; Straiker, A.; Felder, C.C.; Shoham, S.; Kashman, Y.; Huang, S.M.; Lee, H.; Shohami, E.; Mackie, K.; Caterina, M.J.; Walker, J.M.; Fride, E.; Mechoulam, R., *FASEB J.* **2008**, 22, 3024-3034.); and vanilloid analogs, eugenol and ethyl vanillin (Hu, H.Z.; Gu, Q.; Wang, C.; Colton, C.K.; Tang, J.; Kinoshita-Kawada, M.; Lee, L.Y.; Wood, J.D.; Zhu, M.X., *J Biol Chem.* **2004**, 279, 35741-35748; Vogt-Eisele, A.K. *et al.*, **2007**; Xu, H. *et al.*, **2006**). Though relatively weak (EC_{50} , $\sim 40 \mu M$) and nonspecific across TRPs, 2-aminoethoxydiphenylborate (2-APB) and diphenylboronic anhydride (DPBA) have been widely and productively used to characterize key attributes of TRPV3 in cellular assays and electrophysiology (Hu, H.Z. *et al.*, **2004**; Chung, M.K.; Lee, H.; Mizuno, A.; Suzuki, M.; Caterina, M.J. *J Neurosci.* **2004**, 24, 5177-5182; Chung, M.K.; Güler, A.D.; Caterina, M.J., *J Biol Chem.* **2005**, 280, 15928-15941). While heat and direct ligand binding are clearly central to TRPV3 pharmacology, accumulating evidence of potentiation by arachidonic acid, other unsaturated fatty acid derivatives (Hu, H.Z.; Xiao, R.; Wang, C.; Gao, N.; Colton, C.K.; Wood, J.D.; Zhu, M.X., *J Cell Physiol.* **2006**, 208, 201-212), and nitric oxide (Aley, K.O.; McCarter, G.; Levine, J.D., *J Neurosci.* **1998**, 18, 7008-7014; Yoshida, T.; Inoue, R.; Morii, T.; Takahashi, N.; Yamamoto, S.; Hara, Y.; Tominaga, M.; Shimizu, S.; Sato, Y.; Mori, Y., *Nat Chem Biol.* **2006**, 2, 596-607) suggests that authentic activation involves stimulation of G protein-coupled receptors and downstream second messenger signal cascades (e.g., phospholipase C, protein kinase C) that mediate local inflammatory responses and nociceptor sensitization that could enhance TRPV3 function (Xu, H. *et al.*, **2006**) in a pathophysiological, as compared to basal, state.

Evidence suggests that transcriptional regulation of the TRPV3 gene restricts its basal expression and is responsible for enhanced expression following nerve injury. Levels of TRPV3 mRNA recovered from rat L4 and L5 DRG neurons is elevated in the spinal nerve ligation model of neuropathic pain, as compared to uninjured rats (US7396910). Similar upregulation of TRPV3 has been observed in sensory neurons following peripheral nerve injury in humans (Facer, P.; Casula, M.A.; Smith, G.D.; Benham, C.D.; Chessell, I.P.; Bountra, C.; Sinisi, M.; Birch, R.; Anand, P., *BMC Neurol.* **2007**, 7, 11-22; Smith G.D. *et al.*, **2002**).

One feature that distinguishes TRPV3 from the other thermoTRPs is its relatively prominent localization in skin (Peier, A.M. *et al.*, **2002**; Xu, H. *et al.*, **2002**). TRPV3 is also expressed in dorsal root ganglion, trigeminal ganglion, spinal cord and brain (Xu, H. *et al.*,

2002; Smith G.D. *et al.*, 2002). Its distinctive tissue profile, with significant expression in keratinocytes proximal to nociceptive neurons (Chung, M.K.; Lee, H.; Caterina, M.J., *J Biol Chem.* **2003**, 278, 32037-32046; Chung, M.K.; Lee, H.; Mizuno, A.; Suzuki, M.; Caterina, M.J. *J Biol Chem.* **2004**, 279, 21569-21575; Peier, A.M. *et al.*, 2002; Xu, H. *et al.*, 2002) as well as upregulation of TRPV3 in disease states is consistent with a likely role of TRPV3 in pain (Caterina MJ., *Am J Physiol Regul Integr Comp Physiol.* **2007**, 292, R64-R76; Lee, H.; Caterina, M.J., *Pflugers Arch.* **2005**, 451, 160-167; Güler, A.D.; Lee, H.; Iida, T.; Shimizu, I.; Tominaga, M.; Caterina, M., *J Neurosci.* **2002**, 22, 6408-6414; Chung, M.K. *et al.*, 2003; Chung, M.K.; Lee, H.; Mizuno, A.; Suzuki, M.; Caterina, M.J. *J Biol Chem.* **2004**, 279, 21569-21575). In a keratinocyte cell line, stimulation of TRPV3 leads to release of inflammatory mediators including interleukin-1. Thus TRPV3 may also play an important role in regulating inflammation, itch (Steinhoff, M. and Biro, T. *J. Invest. Dermatology*, **2009**, 129, 531-535) and pain that results from the release of inflammatory stimuli. In addition, localization of TRPV3 in non-neuronal tissues, especially skin, suggests also that pharmacological modulation of the channel may provide a therapy to treat diseases that impair the skin barrier (Montell, C. *Cell*, **2010**, April 16, 218-220) and have additional, as yet unidentified, benefit for disease states beyond pain. Accordingly, compounds that can modulate one or more functions of TRPV3 can have various therapeutic utilities.

The present compounds may exist as stereoisomers wherein asymmetric or chiral centers are present. These stereoisomers are "R" or "S" depending on the configuration of substituents around the chiral carbon atom. The terms "R" and "S" used herein are
 20 configurations as defined in IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem., 1976, 45: 13-30.

Various stereoisomers of the present compounds and mixtures thereof are included within the scope of this application. Stereoisomers include enantiomers and diastereomers, and mixtures of enantiomers or diastereomers. Individual stereoisomers may be prepared
 25 synthetically from commercially available starting materials which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by resolution which is well known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography and liberation of the
 30 optically pure product from the auxiliary or (2) direct separation of the mixture of optical enantiomers on chiral chromatographic columns.

Geometric isomers may exist in the present compounds. Various geometric isomers and mixtures thereof resulting from the disposition of substituents around a carbon-carbon double bond, a carbon-nitrogen double bond, a cycloalkyl group, or a heterocycle group are

contemplated. Substituents around a carbon-carbon double bond or a carbon-nitrogen bond are designated as being of Z or E configuration and substituents around a cycloalkyl or a heterocycle are designated as being of cis or trans configuration.

Compounds disclosed herein may exhibit the phenomenon of tautomerism.

Thus, the formulae drawings within this specification can represent only one of the possible tautomeric or stereoisomeric forms. It is to be understood that the invention encompasses any tautomeric or stereoisomeric form, and mixtures thereof, and is not to be limited merely to any one tautomeric or stereoisomeric form utilized within the naming of the compounds or formulae drawings.

Compounds of the invention can exist in isotope-labeled or -enriched form containing one or more atoms having an atomic mass or mass number different from the atomic mass or mass number most abundantly found in nature. Isotopes can be radioactive or non-radioactive isotopes. Isotopes of atoms such as hydrogen, carbon, phosphorous, sulfur, fluorine, chlorine, and iodine include, but are not limited to, ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{32}P , ^{35}S , ^{18}F , ^{36}Cl , and ^{125}I . Compounds that contain other isotopes of these and/or other atoms are within the scope of this invention.

In another embodiment, the isotope-labeled compounds contain deuterium (^2H), tritium (^3H) or ^{14}C isotopes. Isotope-labeled compounds of this invention can be prepared by the general methods well known to persons having ordinary skill in the art. Such isotope-labeled compounds can be conveniently prepared by carrying out the procedures disclosed in the Examples and Schemes sections by substituting a readily available isotope-labeled reagent for a non-labeled reagent. In some instances, compounds may be treated with isotope-labeled reagents to exchange a normal atom with its isotope, for example, hydrogen for deuterium can be exchanged by the action of a deuterium acid such as $\text{D}_2\text{SO}_4/\text{D}_2\text{O}$. In addition to the above, relevant procedures and intermediates are disclosed, for instance, in Lizondo, J et al., *Drugs Fut*, 21(11), 1116 (1996); Brickner, S J et al., *J Med Chem*, 39(3), 673 (1996); Mallesham, B et al., *Org Lett*, 5(7), 963 (2003); PCT publications WO1997010223, WO2005099353, WO1995007271, WO2006008754; US Patent Nos. 7538189; 7534814; 7531685; 7528131; 7521421; 7514068; 7511013; and US Patent Application Publication Nos. 20090137457; 20090131485; 20090131363; 20090118238; 20090111840; 20090105338; 20090105307; 20090105147; 20090093422; 20090088416; and 20090082471, the methods are hereby incorporated by reference.

The isotope-labeled compounds of the invention may be used as standards to determine the effectiveness of TRPV3 modulators in binding assays. Isotope containing

compounds have been used in pharmaceutical research to investigate the *in vivo* metabolic fate of the compounds by evaluation of the mechanism of action and metabolic pathway of the nonisotope-labeled parent compound (Blake et al. *J. Pharm. Sci.* 64, 3, 367-391 (1975)). Such metabolic studies are important in the design of safe, effective therapeutic drugs, either
5 because the *in vivo* active compound administered to the patient or because the metabolites produced from the parent compound prove to be toxic or carcinogenic (Foster et al., *Advances in Drug Research* Vol. 14, pp. 2-36, Academic press, London, 1985; Kato et al., *J. Labelled Comp. Radiopharmaceut.*, 36(10):927-932 (1995); Kushner et al., *Can. J. Physiol. Pharmacol.*, 77, 79-88 (1999)).

10 In addition, non-radio active isotope containing drugs, such as deuterated drugs called "heavy drugs," can be used for the treatment of diseases and conditions related to TRPV3 activity. Increasing the amount of an isotope present in a compound above its natural abundance is called enrichment. Examples of the amount of enrichment include from about 0.5, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 16, 21, 25, 29, 33, 37, 42, 46, 50, 54, 58, 63, 67, 71, 75, 79,
15 84, 88, 92, 96, to about 100 mol %. Replacement of up to about 15% of normal atom with a heavy isotope has been effected and maintained for a period of days to weeks in mammals, including rodents and dogs, with minimal observed adverse effects (Czajka D M and Finkel A J, *Ann. N.Y. Acad. Sci.* 1960 84: 770; Thomson J F, *Ann. New York Acad. Sci* 1960 84: 736; Czajka D M et al., *Am. J. Physiol.* 1961 201: 357). Acute replacement of as high as
20 15%-23% in human fluids with deuterium was found not to cause toxicity (Blagojevic N et al. in "Dosimetry & Treatment Planning for Neutron Capture Therapy", Zamenhof R, Solares G and Harling O Eds. 1994. Advanced Medical Publishing, Madison Wis. pp.125-134; *Diabetes Metab.* 23: 251 (1997)).

Stable isotope labeling of a drug may alter its physico-chemical properties such as
25 pKa and lipid solubility. These effects and alterations may affect the pharmacodynamic response of the drug molecule if the isotopic substitution affects a region involved in a ligand-receptor interaction. While some of the physical properties of a stable isotope-labeled molecule are different from those of the unlabeled one, the chemical and biological properties are the same, with one exception: because of the increased mass of the heavy isotope, any
30 bond involving the heavy isotope and another atom will be stronger than the same bond between the light isotope and that atom. Accordingly, the incorporation of an isotope at a site of metabolism or enzymatic transformation will slow said reactions potentially altering the pharmacokinetic profile or efficacy relative to the non-isotopic compound.

c. Biological Data

(i) In Vitro Methods-Calcium Flux Assays:

Experiments were conducted using the FLIPR^{TETRA}®. On the day prior to the experiment, recombinant HEK293 cells that stably express human and mouse TRPV3 were removed from tissue culture flasks and plated in growth medium at 20,000 cells/well into black-walled clear-bottom 384-well BiocoatTM poly-D-lysine assay plates (BD Biosciences, Bedford, MA) using a Multidrop[®] dispenser (ThermoScientific, Waltham, MA). On the day of the experiment, growth medium was removed, and the no-wash FLIPR[®] Calcium-4 dye ($\lambda_{EX} = 470-495$ nm, $\lambda_{EM} = 515-575$ nm; Molecular Devices, Sunnyvale, CA) was added to each well using the Multidrop[®] dispenser. Cells were incubated for 90-120 minutes in the dark. Compounds were dissolved in DMSO to prepare a 10 mM stock solution. The intensity of the fluorescence was captured and digitally transferred to an interfaced PC. The peak increase in fluorescence over baseline (relative fluorescence units) was calculated and expressed as the percentage of the maximal 2-APB (2-aminoethoxydiphenyl borate) response (in the absence of compound). The concentration of 2-APB corresponds to its EC₈₀. IC₅₀ of the compounds for human TRPV3 are shown in Table 1 wherein "A" refers to an IC₅₀ value of greater than 20 μ M, "B" refers to an IC₅₀ value in range of 5.1 μ M to 20 μ M, "C" refers to an IC₅₀ value in range of 1.1 μ M to 5 μ M, "D" refers to an IC₅₀ value in range of 501 nM to 1,000 nM, "E" refers to an IC₅₀ value in range of 50 nM to 500 nM.

(ii) In Vivo Data Animals

Adult male Sprague-Dawley rats (250-300 g body weight, Charles River Laboratories, Portage, MI) were used. Animal handling and experimental protocols were approved by the Institutional Animal Care and Use Committee (IACUC) at Abbott Laboratories. For all surgical procedures, animals were maintained under isoflurane anesthesia (4-5% to induce, 1-3% to maintain), and the incision sites were sterilized using a 10% povidone-iodine solution prior to and after surgeries.

Sodium Iodoacetate-Induced Knee Joint Osteoarthritic Pain Model

Unilateral knee joint osteoarthritis was induced in the rats by a single intra-articular (i.a.) injection of sodium iodoacetate (3 mg in 0.05 mL sterile isotonic saline) into the right knee joint cavity under light isoflurane anesthesia using a 26G needle. The dose of the sodium iodoacetate (3 mg/i.a.injection) was selected based on results obtained from preliminary studies wherein an optimal pain behavior was observed at this dose. Pain behavioral assessment of hind limb grip force was conducted by recording the maximum compressive force exerted on the hind limb strain gauge setup, in a commercially available grip force measurement system (Columbus Instruments, Columbus, OH). The grip force data was converted to a maximum hindlimb cumulative compressive force (CFmax) (gram force) / kg body weight for each animal. The analgesic effects of test compounds were determined 20 days following the i.a. injection of sodium iodoacetate. The vehicle control group for each

compound being tested was assigned 0% whereas the age matched naïve group was assigned as being 100% (normal). The % effect for each dose group was then expressed as % return to normalcy compared to the naïve group. Compounds were administered either intraperitoneally (i.p.) or orally (p.o.). The assessment of the analgesic effects of test compounds is typically made anytime between about 1 hour and about 5 hours following oral administration. The assessment of the analgesic effects of test compounds is typically made anytime between about 0.5 hour and about 2 hours following i.p. administration. Selection of the preferred time points for measuring the analgesic effects of test compounds was based upon consideration of the individual pharmacokinetic characteristics of test compounds in the rat. Time points that were known or expected to provide higher plasma concentrations of test compounds were preferred over those that were known or expected to provide lower concentrations.

Compounds tested showed a statistically significant change in hind limb grip force strength versus a saline vehicle at less than about 300 $\mu\text{mol/kg}$ in the sodium iodoacetate-induced model of osteoarthritic pain following a single dose, for example, at less than about 50 $\mu\text{mol/kg}$ in the sodium iodoacetate-induced model of osteoarthritic pain following a single dose.

d. Methods of Using the Compounds

Data in Table 1 demonstrates that present compounds are modulators of TRPV3 receptors, and thus are useful in the treatment of diseases, conditions, and/or disorders modulated by TRPV3. The relationship between therapeutic effect and inhibition of TRPV3 has been shown in WO2007/056124; Wissenbach, U. et al., *Biology of the cell* (2004), 96, 47-54; Nilius, B. et al., *Physiol Rev* (2007), 87, 165-217; Okuhara, D. Y. et al., *Expert Opinion on Therapeutic Targets* (2007), 11, 391-401; Hu, H. Z. et al., *Journal of Cellular Physiology* (2006), 208, 201-212.

One embodiment is therefore directed to a method for treating a disease, condition, and/or disorder modulated by TRPV3 in a subject in need thereof, said method comprises administering to the subject a therapeutically effective amount of a compound, or pharmaceutically acceptable salt, solvate, salt of a solvate or solvate of a salt thereof, with or without a pharmaceutically acceptable carrier.

Diseases, conditions, and/or disorders that are modulated by TRPV3 include, but are not limited to, migraine, arthralgia, cardiac pain arising from an ischemic myocardium, acute pain, chronic pain, nociceptive pain, neuropathic pain, post-operative pain, pain due to

neuralgia (e.g., post-herpetic neuralgia, traumatic neuralgia, fibromyalgia, trigeminal neuralgia), pain due to diabetic neuropathy, dental pain and cancer pain, inflammatory pain conditions (e.g. arthritis and osteoarthritis).

Diseases, conditions, and/or disorders that are modulated by TRPV3 also include, but are not limited to, pain such as neuropathic pain, nociceptive pain, dental pain, HIV pain, cardiac pain arising from an ischemic myocardium, pain due to migraine, arthralgia, neuropathies, neurodegeneration, retinopathy, neurotic skin disorder, stroke, urinary bladder hypersensitiveness, urinary incontinence, vulvodynia, gastrointestinal disorders such as irritable bowel syndrome, gastro-esophageal reflux disease, enteritis, ileitis, stomach-duodenal ulcer, inflammatory bowel disease, Crohn's disease, celiac disease, an inflammatory disease such as pancreatitis, a respiratory disorder such as allergic and non-allergic rhinitis, asthma or chronic obstructive pulmonary disease, irritation of skin, eye or mucous membrane, dermatitis, pruritic conditions such as uremic pruritus, fervescence, muscle spasms, emesis, dyskinesias, depression, Huntington's disease, memory deficits, restricted brain function, amyotrophic lateral sclerosis (ALS), dementia, arthritis, osteoarthritis, diabetes, obesity, urticaria, actinic keratosis, keratocanthoma, alopecia, Meniere's disease, tinnitus, hyperacusis, anxiety disorders and benign prostate hyperplasia.

One embodiment provides methods for treating pain (for example, migraine, inflammatory pain, acute pain, chronic pain, neuropathic pain, nociceptive pain, arthritic pain, osteoarthritic pain, post-operative pain, cancer pain, lower back pain, eye pain) in a subject (including human) in need of such treatment. The methods comprise administering to the subject therapeutically effective amount of a compound as described herein, or a pharmaceutically acceptable salt, solvate, salt of a solvate, or solvate of a salt thereof, alone or in combination with a pharmaceutically acceptable carrier. The method further comprises administration of the present compound as a single dose. The method also comprises repeated or chronic administration of the present compound over a period of days, weeks, months, or longer. In certain embodiments, the method comprises administering to the subject a therapeutically effective amount of any of the compounds as described herein, or a pharmaceutically acceptable salt, solvate, salt of a solvate, or solvate of a salt thereof, in combination with a nonsteroidal anti-inflammatory drugs (NSAIDs), or other analgesic (for example, acetaminophen, opioids such as morphine or other related opioids), or combinations thereof.

Another embodiment provides method for increasing the therapeutic effectiveness or potency of compounds described herein by repeated or chronic administration over a period of days, weeks, or months.

Actual dosage levels of active ingredients in the pharmaceutical compositions can be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the duration of treatment, the severity of the condition being treated and the condition and prior medical history of the patient being treated.

However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved. In the treatment of certain medical conditions, repeated or chronic administration of the compounds may be required to achieve the desired therapeutic response. "Repeated or chronic administration" refers to the administration of the compounds daily (i.e., every day) or intermittently (i.e., not every day) over a period of days, weeks, months, or longer. In particular, the treatment of chronic painful conditions is anticipated to require such repeated or chronic administration of compounds described herein. The compounds may become more effective upon repeated or chronic administration such that the therapeutically effective doses on repeated or chronic administration may be lower than the therapeutically effective dose from a single administration.

Compounds can also be administered as a pharmaceutical composition comprising the compounds of interest, or pharmaceutically acceptable salts, solvates, or salts of solvates thereof, in combination with one or more pharmaceutically acceptable carriers. The phrase "therapeutically effective amount" of a compound means a sufficient amount of the compound to treat disorders, at a reasonable benefit/risk ratio applicable to any medical treatment. It will be understood, however, that the total daily usage of the compounds and compositions will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder being treated and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well-known in the medical arts. For example, it is well

within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The compounds may be administered alone, or in combination with one or more other compounds described herein, or in combination (i.e. co-administered) with one or more additional pharmaceutical agents. For example, one or more compounds, or pharmaceutically acceptable salts, solvates, salts of solvates, or solvates of salts thereof, may be administered in combination with one or more analgesic (e.g. acetaminophen, opioid such as morphine), or with one or more nonsteroidal anti-inflammatory drugs (NSAIDs), or combinations thereof.

Non-limiting examples of NSAIDs include, but not limited to, aspirin, diclofenac, diflusal, etodolac, fenbufen, fenoprofen, flufenisal, flurbiprofen, ibuprofen, indomethacin, ketoprofen, ketorolac, meclofenamic acid, mefenamic acid, meloxicam, nabumetone, naproxen, nimesulide, nitroflurbiprofen, olsalazine, oxaprozin, phenylbutazone, piroxicam, sulfasalazine, sulindac, tolmetin and zomepirac. In certain embodiments, the nonsteroidal anti-inflammatory drug (NSAID) is ibuprofen. Combination therapy includes administration of a single pharmaceutical dosage formulation containing one or more of the compounds and one or more additional pharmaceutical agents, as well as administration of the compounds and each additional pharmaceutical agent, in its own separate pharmaceutical dosage formulation. For example, one or more compounds described herein and one or more additional pharmaceutical agents, may be administered to the patient together, in a single oral dosage composition having a fixed ratio of each active ingredient, such as a tablet or capsule; or each agent may be administered in separate oral dosage formulations.

Where separate dosage formulations are used, the compounds and one or more additional pharmaceutical agents may be administered at essentially the same time (e.g., concurrently) or at separately staggered times (e.g., sequentially).

The total daily dose of the compounds administered to a human or other animal range from about 0.01 mg/kg body weight to about 100 mg/kg body weight, for example, in the range of from about 0.03 mg/kg body weight to about 30 mg/kg body weight. If desired, the effective daily dose can be divided into multiple doses for purposes of administration.

Consequently, single dose compositions may contain such amounts or submultiples thereof to make up the daily dose. It is understood that the effective daily dose may vary with the duration of the treatment.

e. Pharmaceutical Compositions

Further provided herein is a pharmaceutical composition that comprises a compound or a pharmaceutically acceptable salt, solvate, salt of a solvate, or solvate of a salt thereof, formulated together with a pharmaceutically acceptable carrier.

Another aspect provides pharmaceutical composition comprising a compound or a pharmaceutically acceptable salt, solvate, salt of a solvate, or solvate of a salt thereof, in combination with an analgesic (e.g. acetaminophen or opioid such as morphine or other related opioids), or in combination with a nonsteroidal anti-inflammatory drugs (NSAIDs), or a combination thereof, formulated together with a pharmaceutically acceptable carrier.

The pharmaceutical compositions can be administered to humans and other mammals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments or drops), buccally or as an oral or nasal spray. The term "parenterally" as used herein, refers to modes of administration which include intravenous, intramuscular, intraperitoneal, intrasternal, subcutaneous and intraarticular injection and infusion.

The term "pharmaceutically acceptable carrier" as used herein, means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as, but not limited to, lactose, glucose and sucrose; starches such as, but not limited to, corn starch and potato starch; cellulose and its derivatives such as, but not limited to, sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as, but not limited to, cocoa butter and suppository waxes; oils such as, but not limited to, peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols; such a propylene glycol; esters such as, but not limited to, ethyl oleate and ethyl laurate; agar; buffering agents such as, but not limited to, magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as, but not limited to, sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

Pharmaceutical compositions for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene

glycol and the like), vegetable oils (such as olive oil), injectable organic esters (such as ethyl oleate) and suitable mixtures thereof. Proper fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

5 These compositions may also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorganisms can be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid and the like. It may also be desirable to include isotonic agents such as sugars, sodium chloride and the like. Prolonged absorption of the injectable
10 pharmaceutical form can be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

 In some cases, in order to prolong the effect of the drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This can be accomplished by the use of a liquid suspension of crystalline or amorphous material with
15 poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

 Injectable depot forms are made by forming microencapsule matrices of the drug in
20 biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

25 The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

 Solid dosage forms for oral administration include capsules, tablets, pills, powders
30 and granules. In such solid dosage forms, the active compound may be mixed with at least one inert, pharmaceutically acceptable excipient or carrier, such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol and silicic acid; b) binders such as carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose and acacia; c) humectants such as glycerol; d) disintegrating

agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates and sodium carbonate; e) solution retarding agents such as paraffin; f) absorption accelerators such as quaternary ammonium compounds; g) wetting agents such as cetyl alcohol and glycerol monostearate; h) absorbents such as kaolin and bentonite clay and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such carriers as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills and granules can be prepared with coatings and shells such as enteric coatings and other coatings well-known in the pharmaceutical formulating art. They may optionally contain opacifying agents and may also be of a composition such that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned carriers.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan and mixtures thereof.

Besides inert diluents, the oral compositions may also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring and perfuming agents.

Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, tragacanth and mixtures thereof.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating carriers or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at room temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

The present compounds can also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals which are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients and the like. The preferred lipids are natural and synthetic phospholipids and phosphatidyl cholines (lecithins) used separately or together.

Methods to form liposomes are known in the art. See, for example, Prescott, Ed., Methods in Cell Biology, Volume XIV, Academic Press, New York, N.Y. (1976), p. 33 et seq.

Dosage forms for topical administration include powders, sprays, ointments and inhalants. The active compound may be mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers or propellants which may be required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

The compounds can be used in the form of pharmaceutically acceptable salts derived from inorganic or organic acids. The phrase "pharmaceutically acceptable salt" means those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like and are commensurate with a reasonable benefit/risk ratio.

Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge et al. describe pharmaceutically acceptable salts in detail in (J. Pharmaceutical Sciences, 1977, 66: 1 et seq). The salts can be prepared in situ during the final isolation and purification of the compounds or separately by reacting a free base function with a suitable organic acid. Representative acid addition salts include, but are not limited to acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethansulfonate

(isothionate), lactate, malate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, palmitoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, phosphate, glutamate, bicarbonate, p-toluenesulfonate and undecanoate. Also, the basic nitrogen-containing groups can be quaternized with such agents
5 as lower alkyl halides such as, but not limited to, methyl, ethyl, propyl, and butyl chlorides, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as, but not limited to, decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; arylalkyl halides like benzyl and phenethyl bromides and others. Water or oil-soluble or dispersible products are thereby obtained. Examples of acids which
10 can be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, hydrobromic acid, sulfuric acid, and phosphoric acid and such organic acids as acetic acid, fumaric acid, maleic acid, 4-methylbenzenesulfonic acid, succinic acid and citric acid.

Basic addition salts can be prepared in situ during the final isolation and purification
15 of the compounds by reacting a carboxylic acid-containing moiety with a suitable base such as, but not limited to, the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia or an organic primary, secondary or tertiary amine. Pharmaceutically acceptable salts include, but are not limited to, cations based on alkali metals or alkaline earth metals such as, but not limited to, lithium, sodium, potassium,
20 calcium, magnesium and aluminum salts and the like and nontoxic quaternary ammonia and amine cations including ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, diethylamine, ethylamine and the like. Other representative organic amines useful for the formation of base addition salts include ethylenediamine, ethanolamine, diethanolamine, piperidine, piperazine and the like.

25 The compounds can exist in unsolvated as well as solvated forms, including hydrated forms, such as hemi-hydrates. In general, the solvated forms, with pharmaceutically acceptable solvents such as water and ethanol among others are equivalent to the unsolvated forms for the purposes of the invention.

Scheme 1

Reduction of nitriles of formula (1) with a reducing agent such as, but not limited to, diisobutylaluminum hydride, at a temperature of about $-78^\circ C$, and in a solvent such as, but not limited to, dichloromethane, produces aldehydes of formula (2). Treatment of the aldehydes (2) with trialkylstannyl of formula (3) in the presence of n-butyllithium and in a solvent such as, but not limited to, tetrahydrofuran, provides alcohols of formula (4). The reaction is generally conducted at low temperature, such as at about $-78^\circ C$ to about $-100^\circ C$.

Alternatively, compounds of formula (4) can be prepared from the nitriles of formula (1) by (a) treatment with a bromide of formula G^1-Br in the presence of n-butyllithium and at

about -78 °C; and (b) treating the intermediate from step (a) with sulfuric acid at about 40 to about 60 °C; to provide ketones of formula (5); and subsequently reducing the ketones with a reducing agent such as, but not limited to, sodium borohydride at about room temperature, in a solvent such as, but not limited to, methanol.

Chiral alcohols of formula (4a) and (4b) can be obtained by separation of the enantiomers using chiral columns or by chiral reduction of the ketones of formula (5), for example, by reducing (5) in the presence of a chiral agent such as, but not limited to, (S,S)-N-(p-touenesulfonyl)-1,2-diphenylethanediamine(chloro)(p-cumene)ruthenium (II), and a hydrogen source such as, but not limited to, formic acid, ammonium formate, or gaseous hydrogen.

The reaction is generally conducted in the presence of a base such as, but not limited to, sodium hydride, and in an aprotic solvent such as, but not limited to, DMSO, and at a temperature ranging from about 0 °C to about 50 °C, typically at about room temperature. Alternatively, the conversion can be achieved utilizing lithium diisopropyl amide as a base, and at a temperature of about -78 °C.

Scheme 3 further illustrates synthetic methods for the preparation of the intermediate nitriles used in Scheme 1.

pyrimidin-2-yl{1-[4-(trifluoromethoxy)phenyl]cyclobutyl}methanol

Example 31A

1-[4-(trifluoromethoxy)phenyl]cyclobutanecarbonitrile

To sodium hydride (4.4 g, 110mmol) was slowly added DMSO (100 mL) at 0 °C.

The mixture was warmed to room temperature and stirred for 10 minutes. A solution of 2-(4-(trifluoromethoxy)phenyl)acetonitrile (10.05 g, 50 mmol) and 1,3-dibromopropane (11.0 g, 55 mmol) in diethyl ether (50 ml) was added over 30 min at ≤ 30 °C. Near the end of the addition, the mixture became very thick purple slurry that could not be stirred. An additional 50 mL of DMSO was added. After stirring for 75 min at room temperature, the reaction was complete according to LCMS. The reaction mixture was diluted with 25 mL of isopropanol and 15 mL of water, and extracted with ether. The organic layer was washed with water and

brine, dried (Na_2SO_4), filtered, and concentrated to give the title compound. (10.85 g yield 90%).
