

ABSTRACT OF THE DISCLOSURE**HINGE ASSEMBLAGE**

A hinge assemblage includes a leaf mechanism, an actuating unit and a damping unit. The leaf mechanism
5 includes a first leaf, and a second leaf pivotable relative to the first leaf such that the hinge assemblage is convertible between first and second states. The actuating unit is mounted to the leaf mechanism, and generates an actuating force during the conversion of
10 the hinge assemblage. The damping unit is mounted to the leaf mechanism for generating a damping force. The damping force generated by the damping unit during the conversion of the hinge assemblage toward the first state is different from the damping force generated by the
15 damping unit during the conversion of the hinge assemblage toward the second state.
