

A CAPSULE FOR PREPARING INFUSIONS

ABSTRACT

5

A capsule (1) for preparing infusions from a product contained in a closed inner chamber (2), by forcing a liquid under pressure through the chamber (2). The capsule (1) comprises a frustoconical main body (4) and a peripheral flange (6) extending outwardly from the larger base (8) of said main body (4). The capsule (1)
10 further comprises an annular hermetic closing member (12) provided on the region of the capsule (1) comprised between the surface of said flange (6) facing the smaller base (10) of the main body (4) and the smaller base (10) of the main body (4). The closing member (12) comprises a plurality of discrete blind openings (14) penetrating in the closing member (12), such that the closing member (12) is
15 deformable under pressure during the preparation of the infusion.
