

Tri-Functional UV-Absorbing Compounds and Use Thereof

[0001] This invention is related to a class of compounds useful for making ophthalmic lenses (including contact lenses and intraocular lenses) capable of blocking ultra-violet ("UV") radiation and thereby protecting corneal to some extent from damages caused by UV radiation. This invention also provides UV-absorbing ophthalmic lenses and methods for making UV-absorbing ophthalmic lenses.

BACKGROUND

[0002] In general, contact lenses are produced in mass by a so-called cast-molding process, which involves thermo- or UV-photo-induced free-radical polymerization of a lens-forming composition including vinylic monomers and/or vinylic macromers in molds. UV photo-induced polymerization process is generally preferred because its processing cycle is shorter than the thermo-induced polymerization process. In certain applications, it is desirable to incorporate UV absorbers into the ophthalmic lens. One approach is to copolymerize a polymerizable UV absorber with the other lens-forming vinylic monomers and/or macromer so that the UV absorber is covalently attached to the copolymer. Copolymerizable benzotriazole, benzophenone and triazine UV absorbers, which include an ethylenically unsaturated group covalently linked to their UV-absorbing moieties, are known and have been used previously. However, there are several disadvantages associated with use of a known polymerizable UV-absorber. First, the efficiency of incorporation of the UV-absorber in lenses may not be certain. Further, a UV-absorber present in a lens forming composition can reduce the amount of UV radiation available to initiate polymerization and may even lower the efficiency of covalent incorporation of the UV absorber into resultant lenses. Unreacted UV absorbers generally must be removed from the lenses in one or more extraction processes. Second, a UV-absorber may result in ineffective or uneven photo-polymerization of the lens forming composition.

[0003] Therefore, it would be desirable to have a new UV-absorbing compound that has a relatively high efficiency of incorporation and minimal adverse effect on the UV photo-polymerization of lens forming compositions.

SUMMARY

[0004] Described herein are tri-functional compounds useful in the production of UV-blocking (or UV-absorbing) ophthalmic lenses. The compounds are composed of a UV

absorbing moiety, a polymerization initiator moiety directly or indirectly bonded to the UV absorbing moiety, and an olefinically (or ethylenically) unsaturated group directly or indirectly bonded to the UV-absorbing moiety and capable of undergoing polymerization with other lens-forming materials (e.g., ethylenically unsaturated compounds). In preferred embodiments, the compounds do not necessarily interfere with the polymerization of lens-forming materials upon curing. Also described herein are polymers and ophthalmic lenses produced from the tri-functional compounds described herein as well as methods for making UV-absorbing ophthalmic lenses by using a tri functional UV-absorbing compound of the invention. The advantages of the invention will be set forth in part in the description which follows, and in part will be obvious from the description, or may be learned by practice of the aspects described below. The advantages described below will be realized and attained by means of the elements and combinations particularly pointed out in the appended claims. It is to be understood that both the foregoing general description and the following detailed description are exemplary and explanatory only and are not restrictive.

BRIEF DESCRIPTION OF THE DRAWINGS

[0005] The accompanying drawings, which are incorporated in and constitute a part of this specification, illustrate several aspects described below.

[0006] Figure 1 shows the structures of some preferred tri-functional compounds of the invention.

[0007] Figures 2-8 show exemplary reaction schemes for producing preferred tri-functional compounds of the invention.

DETAILED DESCRIPTION

[0008] Before the present tri-functional compounds, compositions, and methods are disclosed and described, it is to be understood that the aspects described below are not limited to specific compounds, synthetic methods, or uses as such may, of course, vary. It is also to be understood that the terminology used herein is for the purpose of describing particular aspects only and is not intended to be limiting.

[0009] In this specification and in the claims that follow, reference will be made to a number of terms that shall be defined to have the following meanings:

[00010] It must be noted that, as used in the specification and the appended claims, the singular forms “a,” “an” and “the” include plural referents unless the context clearly dictates otherwise. Thus, for example, reference to “a monomer” includes mixtures of two or more such monomers, and the like.

[00011] “Optional” or “optionally” means that the subsequently described event or circumstance can or cannot occur, and that the description includes instances where the event or circumstance occurs and instances where it does not. For example, the phrase “optional linker” means that the linker can or cannot be present.

[00012] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. As employed throughout the disclosure, the following terms, unless otherwise indicated, shall be understood to have the following meanings.

[00013] The term “alkyl group” as used herein is a monovalent radical of a branched or unbranched saturated hydrocarbon having 1 to 24 carbon atoms. A “lower alkyl” group is an alkyl group containing from one to six carbon atoms.

[00014] The term “aryl group” as used herein is any carbon-based aromatic group including, but not limited to, benzene, naphthalene, etc. The term “aromatic” also includes “heteroaryl group,” which is defined as an aromatic group that has at least one heteroatom incorporated within the ring of the aromatic group. Examples of heteroatoms include, but are not limited to, nitrogen, oxygen, sulfur, and phosphorus. The aryl group can be substituted or unsubstituted. The aryl group can be substituted with one or more groups including, but not limited to, alkyl, alkynyl, alkenyl, aryl, halide, nitro, amino, ester, ketone, aldehyde, hydroxy, carboxylic acid, or alkoxy.

[00015] The term “alkoxy group” as used herein has the formula $-OR$, where R is an alkyl group as defined herein.

[00016] The term “aryloxy group” as used herein has the formula $-OR'$, where R' is an aryl group as defined herein.

[00017] The term “aralkyl group” as used herein has the formula $-R-R'$, where R and R' are an alkyl group and aryl group, respectively, as defined herein. An example of an aralkyl group is a benzyl group ($-\text{CH}_2\text{Ph}$).

- [00018] The term “alkylene” as used herein refers to a divalent radical of hydrocarbon
- [00019] The term “alkylene oxide group” as used herein is a group composed of one or more repeat units having the formula $-(R^a)_nO-$, where R^a is a linear or branched C_1 - C_{12} -alkylene and n is from 1 to 10.
- [00020] The term “amino group” as used herein has the formula $-NR^bR^c$, where R^b and R^c are, independently, hydrogen, a C_1 - C_{12} linear or branched alkyl group, or a C_6 - C_{24} aryl group.
- [00021] The term “alkylene amine group” as used herein is a group composed of one or more repeat units having the formula $-(R^a)_nNR^d$, where R^a is a linear or branched C_1 - C_4 -alkylene, n is from 1 to 10, and R^d is hydrogen, an alkyl group, or an aryl group.
- [00022] The term “dicarbonyl group” as used herein is a group or molecule composed of two $C=O$ groups. Each carbonyl group, independently, can be present as an aldehyde, ketone, ester, anhydride, or carboxylic acid group.
- [00023] The term “silicon group” as used herein is a group or molecule composed of at least one silicon atom. The silicon group can be substituted with one or more alkyl groups, where the alkyl groups can be the same or different.
- [00024] A “hydrogel” refers to a polymeric material that can absorb at least 10 percent by weight of water when it is fully hydrated. A hydrogel material can be obtained by polymerization or copolymerization of at least one hydrophilic monomer in the presence of or in the absence of additional monomers and/or macromers or by crosslinking of a prepolymer.
- [00025] A “silicone hydrogel” refers to a hydrogel obtained by copolymerization of a polymerizable composition comprising at least one silicone-containing vinylic monomer or at least one silicone-containing macromer or a silicone-containing prepolymer.
- [00026] “Hydrophilic,” as used herein, describes a material or portion thereof that will more readily associate with water than with lipids.
- [00027] A “monomer” means a low molecular weight compound that can be polymerized actinically, thermally, or chemically. Low molecular weight typically means average molecular weights less than 700 Daltons.
- [00028] As used herein, “actinically” in reference to curing or polymerizing of a lens-forming material means that the curing (e.g., crosslinked and/or polymerized) is performed by

actinic irradiation, such as, for example, UV irradiation, visible light irradiation, ionized radiation (e.g. gamma ray or X-ray irradiation), microwave irradiation, and the like. Actinic curing methods are well-known to a person skilled in the art.

[00029] A “vinyl monomer,” as used herein, refers to a low molecular weight compound that has an ethylenically unsaturated group and can be polymerized actinically or thermally. Low molecular weight typically means average molecular weights less than 700 Daltons.

[00030] A “hydrophilic vinyl monomer,” as used herein, refers to a vinyl monomer that is capable of forming a homopolymer that can absorb at least 10 percent by weight water when fully hydrated. Examples of hydrophilic vinyl monomers include without limitation hydroxyl-substituted lower alkyl (C_1 to C_3) (meth)acrylates, hydroxyl-substituted lower alkyl vinyl ethers, C_1 to C_3 alkyl(meth)acrylamide, di- (C_1-C_3) alkyl(meth)acrylamide, N-vinylpyrrole, N-vinyl-2-pyrrolidone, 2-vinylloxazoline, 2-vinyl-4,4'-dialkylloxazolin-5-one, 2- and 4-vinylpyridine, amino(lower alkyl)- (where the term “amino” also includes quaternary ammonium), mono(lower alkylamino)(lower alkyl) and di(lower alkylamino)(lower alkyl)(meth)acrylates, allyl alcohol, N-vinyl C_1 to C_3 alkylamide, N-vinyl-N- C_1 to C_3 alkylamide, C_1-C_4 -alkoxy polyethylene glycol (meth)acrylate having a weight average molecular weight of up to 1500, and the like. Examples of preferred hydrophilic vinyl monomers are N,N-dimethylacrylamide (DMA), N,N-dimethylmethacrylamide (DMMA), 2-acrylamidoglycolic acid, 3-acryloylamino-1-propanol, N-hydroxyethyl acrylamide, N-[tris(hydroxymethyl)methyl]-acrylamide, N-methyl-3-methylene-2-pyrrolidone, 1-ethyl-3-methylene-2-pyrrolidone, 1-methyl-5-methylene-2-pyrrolidone, 1-ethyl-5-methylene-2-pyrrolidone, 5-methyl-3-methylene-2-pyrrolidone, 5-ethyl-3-methylene-2-pyrrolidone, 1-n-propyl-3-methylene-2-pyrrolidone, 1-n-propyl-5-methylene-2-pyrrolidone, 1-isopropyl-3-methylene-2-pyrrolidone, 1-isopropyl-5-methylene-2-pyrrolidone, 1-n-butyl-3-methylene-2-pyrrolidone, 1-tert-butyl-3-methylene-2-pyrrolidone, 2-hydroxyethylmethacrylate (HEMA), 2-hydroxyethyl acrylate (HEA), hydroxypropyl acrylate, hydroxypropyl methacrylate (HPMA), trimethylammonium 2-hydroxy propylmethacrylate hydrochloride, aminopropyl methacrylate hydrochloride, dimethylaminoethyl methacrylate (DMAEMA), glycerol methacrylate (GMA), N-vinyl-2-pyrrolidone (NVP), allyl alcohol, vinylpyridine, a C_1-C_4 -alkoxy polyethylene glycol (meth)acrylate having a weight average molecular weight of up to 1500, N-vinyl formamide, N-vinyl acetamide, N-vinyl isopropylamide, N-vinyl-N-methyl acetamide, allyl alcohol, N-vinyl caprolactam, and mixtures thereof.

[00031] A “hydrophobic vinylic monomer,” as used herein, refers to a vinylic monomer that is capable of forming a homopolymer that can absorb less than 10 percent by weight water. Nearly any hydrophobic vinylic monomer can be used. Examples of preferred hydrophobic vinylic monomers include methylacrylate, ethyl-acrylate, propylacrylate, isopropylacrylate, cyclohexylacrylate, 2-ethylhexylacrylate, methylmethacrylate, ethylmethacrylate, propylmethacrylate, vinyl acetate, vinyl propionate, vinyl butyrate, vinyl valerate, styrene, chloroprene, vinyl chloride, vinylidene chloride, acrylonitrile, 1-butene, butadiene, methacrylonitrile, vinyl toluene, vinyl ethyl ether, perfluorohexylethyl-thio-carbonyl-aminoethyl-methacrylate, isobornyl methacrylate, trifluoroethyl methacrylate, hexafluoro-isopropyl methacrylate, hexafluorobutyl methacrylate, combinations thereof.

[00032] A “macromer” refers to a medium to high molecular weight compound or polymer that contains functional groups capable of undergoing further polymerizing/crosslinking reactions. Medium and high molecular weight typically means average molecular weights greater than 700 Daltons. In one aspect, the macromer contains ethylenically unsaturated groups and can be polymerized actinically or thermally.

[00033] A “prepolymer” refers to a starting polymer that can be cured (e.g., crosslinked and/or polymerized) actinically or thermally to obtain a crosslinked and/or polymerized polymer having a molecular weight much higher than the starting polymer.

[00034] Described herein are tri-functional compounds useful in the production of UV-absorbing ophthalmic lenses. The compounds generally have (1) an ultraviolet absorber moiety (or component), (2) a polymerization initiator moiety, and (3) an olefinically unsaturated group capable of undergoing polymerization. Each component is covalently attached within a single molecule. In one aspect, the tri-functional compound is defined by formula I

wherein:

Z is a divalent radical which comprises a benzotriazole moiety or benzophenone moiety and is defined by formula (1a), (1b), (1c) or (1d)

in which R^{3a} , R^{3b} , R^{3c} , R^{2z} , R^{3z} , R^{4z} , and R^{1z} , independent of another, are hydrogen, halogen (Cl, Br, or I), C_1 - C_{12} linear or branched alkyl group, C_1 - C_{12} linear or branched alkoxy group, C_6 - C_{24} aryl or substituted aryl group, PG is a protective labile group (e.g., C_1 - C_{18} alkylcarbonyl, tri(C_1 - C_{12} alkyl)silyl, C_1 - C_{18} linear or branched alkyl, C_1 - C_{18} linear or branched alkoxyalkyl, and others described later in this application);

X is a monovalent radical comprising a radical initiator moiety selected from the group

consisting of phosphine oxide (a trivalent radical $\text{—}\overset{\text{O}}{\overset{\text{O}}{\text{C}}}\text{—}\overset{\text{O}}{\text{P}}\text{—}$), a peroxide group, an azide group, an α -hydroxyketone, or an α -aminoketone;

Y is a monovalent radical of formula (2)

in which Z_1 and Z_2 independent of each other are a covalent bond, a linear or branched C_1 - C_{12} alkylene divalent radical, a linear or branched C_1 - C_{12} alkylene divalent radical having one or more hydroxyl groups, a radical of $\text{—}(\text{CH}_2\text{CH}_2\text{O})_d\text{—CH}_2\text{CH}_2\text{—}$ in which d is an integer of 1 to 10, unsubstituted phenylene divalent radical, C_1 - C_4 alkyl or C_1 - C_4 alkoxy substituted

phenylene divalent radical, C_7 - C_{12} aralkylene divalent radical, —O— or $\text{—}\overset{\text{R}'}{\text{N}}\text{—}$ in which R' is

H or C_1 - C_8 alkyl; A_5 is a covalent bond, —O— or $\text{—}\overset{\text{R}'}{\text{N}}\text{—}$ in which R' is H or C_1 - C_8 alkyl; q_1 and q_2 independent of each other are an integer of 0 or 1; R_{14} is hydrogen, C_1 - C_4 alkyl or halogen; R_{15} and R_{16} independent of each other are hydrogen, C_1 - C_4 alkyl, phenyl, carboxy,

halogen, or a radical of $\text{—}\overset{\text{O}}{\parallel}{\text{C}}\text{—X}_3\text{—R}_{17}$ in which X_3 is —O— , $\text{—}\overset{\text{R}'}{\underset{|}{\text{N}}}\text{—}$ as defined above or —S— and R_{17} is a $\text{C}_1\text{—C}_{12}$ alkyl, $\text{C}_1\text{—C}_{12}$ hydroxyalkyl, $\text{C}_1\text{—C}_{12}$ aminoalkyl, alkylaminoalkyl having up to 24 carbon atoms, or dialkylaminoalkyl having up to 24 carbon atoms; and L^1 and L^2 independently of each other are a covalent bond or a linker.

Each component is described in detail below.

[00035] In a preferred embodiment, the ultraviolet absorber comprises a benzotriazole or a benzophenone. Many benzotriazole and benzophenone UV absorbers are known and many are commercially available. The identity of the benzotriazole or benzophenone UV absorber is not critical, but should be selected based on its characteristic UV cut-off to give the desired UV absorbing property. In one aspect, the benzotriazole UV absorber can be a hydroxyphenyl-benzotriazole and the benzophenone UV absorber can be a hydroxyphenylbenzophenone. Preferably, the UV absorber moiety Z of the tri-functional compound has the formula (1a) in which R^{3b} , R^{3c} and R^{1z} are hydrogen and R^{3a} is R^3 which is hydrogen, halogen, a $\text{C}_1\text{—C}_{12}$ linear or branched alkyl group, a $\text{C}_1\text{—C}_{12}$ linear or branched alkoxy group, or a $\text{C}_6\text{—C}_{24}$ aryl or substituted aryl group, as shown by formula X

[00036] The tri-functional compounds described herein contain one or more polymerization initiator moieties directly or indirectly bonded to the ultraviolet absorber component. The initiator can be a thermal initiator (*i.e.*, initiates polymerization by exposure to heat) or photoinitiator (*e.g.*, when exposed to actinic energy). Preferably, when the initiator is a photoinitiator, the photoinitiator moiety comprises a phosphine oxide, a peroxide group, an azide group, an α -hydroxyketone, or an α -aminoketone. Other type 1 and type 2 initiators can be also used such as, for example, thioxanthenes and benzildimethylketals.

[00037] Examples of preferred phosphine oxide photoinitiator moieties comprise a monovalent radical of formula XI

wherein t_1 and t_2 independent of each other are 0 or 1 provided that at least one of t_1 and t_2 is 1, one of Q^{1a} and Q^{1b} is a covalent bond (connecting to a linker or directly to the UV-absorber moiety) and the other is hydrogen, C_1 - C_{12} linear or branched alkyl group, or C_1 - C_{12} linear or branched alkoxy group, Q^{2a} , Q^{2b} , Q^{3a} , Q^{3b} independently of one another hydrogen are C_1 - C_{12} linear or branched alkyl group, or C_1 - C_{12} linear or branched alkoxy group.

[00038] Examples of preferred peroxide groups as initiator moieties are those of formula XII

where V is a covalent bond or oxygen and R is a C_1 - C_{20} linear or branched alkyl group (e.g., for example, $-(CH_2)_nH$ ($n = 1-18$); $-CH(CH_3)CH_3$; $-C(CH_3)_3$; $-CH(CH_3)CH_2CH_3$; $-C(CH_3)_2CH_2C(CH_3)_3$; $-C(CH_3)_2(CH_2)_4H$; $-C(CH_2CH_3)_2(CH_2)_4H$; $-C(CH_3)_2(CH_2)_5H$; $-C(CH_2CH_3)_2(CH_2)_5H$; $-C(CH_3)_2(CH_2)_6H$; or $-C(CH_2CH_3)_2(CH_2)_6H$) or phenyl group.

[00039] Examples of azide groups ($-N=N-$) are provided in International Patent Application Publication No. WO 2004/062371. For example, 4,4'-azobis (4-cyanopentanoic acid) manufactured by Wako Chemicals can be used herein.

[00040] In another preferred embodiment, the monovalent photoinitiator moiety comprises a monovalent radical of an α -hydroxyketone or an α -aminoketone of the formula IIa or IIb

wherein R is oxygen, nitrogen, a linear or branched C_1 - C_{12} alkylene divalent radical, a

divalent radical of $-OCH_2CH_2O-$, a divalent radical of $-alk-\overset{R^{II}}{N}-$ in which R^{II} is hydrogen or a C_1 - C_{12} alkyl radical and alk is C_1 - C_{12} alkylene divalent radical, or combinations thereof, R^1 and R^2 are, independently, hydrogen, a C_1 - C_{12} linear or branched alkyl group, a C_6 - C_{24} aryl or substituted aryl group, a C_7 - C_{24} aralkyl group; and A comprises a hydroxyl group, a C_1 - C_{12} alkoxy group, a C_6 - C_{24} aryloxy group, or a primary, secondary or tertiary amino group.

[00041] Preferably, the monovalent photoinitiator moiety comprises the formula III or Iva or b

in which Ph is phenyl and Me is methyl.

[00042] Functionalized α -hydroxyketones suitable for use as UV polymerization initiators are commercially available. For example, 2-hydroxy-1-[4-(2-hydroxyethoxy)phenyl]-2-methylpropan-1-one (Irgacure® 2959, Ciba Specialty Chemicals) contains a free primary hydroxyl group that can be used to directly or indirectly bond the photoinitiator to the ultraviolet absorber component. Other examples of commercially available α -hydroxyketones include, but are not limited to, Irgacure® 369 and 379 and Darocure 1173.

[00043] The tri-functional compounds described herein also include one or more olefinic groups. The term “olefinic group” or “ethylenically unsaturated group” is defined in this application as any group containing at least one C=C group. Exemplary olefinic groups include without limitation acrylate, methacrylate, acrylamide, methacrylamide, allyl, vinyl, vinylester, or styrenyl. The olefinic groups are capable of being polymerized with other monomers or polymers having olefinic groups upon exposure with actinic radiation or heating.

[00044] In another preferred embodiment, when the initiator and/or olefinic group are indirectly bonded to the ultraviolet absorber, a linker can be used. A variety of different groups can be used as the linker. The length of the linker can vary as well. Additionally, the selection of the linker can vary the hydrophilic/hydrophobic properties of the tri-functional compound. This is particularly useful when certain solvents are used during the manufacturing of the ophthalmic lens. Examples of linkers (L^1 and/or L^2) useful herein include, but are not limited to, a silicon group, a carbonyl group, a dicarbonyl group, a C_1 to C_{12} linear or branched alkylene group, a C_1 to C_{12} linear or branched alkylene oxide group, a

C₆ to C₂₄ arylalkylene or arylene divalent radical (e.g., -Ph- or -CH(Ph)-), C₁ to C₁₂ linear or

branched alkylene amine group, , or combinations thereof. Any combination of these groups is also contemplated.

[00045] Preferably, L¹ and L² in formula I independently of each other are a covalent bond or a divalent radical of $-X_a-E_1-X_b-E_2-X_c-$ in which:

X_a is a covalent bond, carbonyl ($-\overset{\text{O}}{\parallel}{\text{C}}-$),  in which R^e and R^f independently of each other are a C₁-C₈-alkyl, phenyl or a C₁-C₄ alkyl- or C₁-C₄-alkoxy-substituted phenyl, a divalent radical of $-(R^aO)_n-$ in which R^a is a linear or branched C₁-C₁₂-alkylene and n is from 1 to 10, $-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, or $-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$ in which R'' is H or C₁-C₈ alkyl;

E₁ and E₂ independently of each other are a covalent bond, a divalent radical of $-(R^aO)_n-$

in which R^a and n are defined above, , $-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, or $-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$ in which R'' is H or C₁-C₈ alkyl, a C₁ to C₁₂ linear or branched alkylene divalent radical, a cycloalkyl diradical with up to 40 carbon atoms, an alkylcycloalkyl diradical with up to 40 carbon atoms, an alkylaryl diradical with up to 40 carbon atoms, an arylalkylene divalent radical with up to 40 carbon atoms, or a dicarbonyl group having the formula $-\text{C}(\text{O})\text{L}^3\text{C}(\text{O})-$ in which L³ is a C₁ to C₁₂ linear or branched alkylene divalent radical or $-(R^{e1}-O)_{w1}-(R^{e2}-O)_{w2}-(R^{e3}-O)_{w3}-$, wherein R^{e1}, R^{e2}, and R^{e3} independently of one another are a linear or branched C₁-C₄-alkylene and w₁, w₂ and w₃ independently of one another are a number from 0 to 20 provided that the sum of (n+m+p) is 1 to 60; and

X_b and X_c independently of each other are a covalent bond, $-\overset{\text{O}}{\parallel}{\text{C}}-$, $-\text{O}-$, $-\overset{\text{R}''}{\text{N}}-$, $-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$, $-\overset{\text{R}''}{\text{N}}-\overset{\text{O}}{\parallel}{\text{C}}-$, $-\overset{\text{R}''}{\text{N}}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}-$, $-\text{HN}-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$, $-\text{O}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}-$, $-\text{HN}-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, $-\text{S}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}-$, $-\text{O}-\overset{\text{O}}{\parallel}{\text{C}}-$, $-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, $-\text{S}-$, and $-\text{HN}-\overset{\text{O}}{\parallel}{\text{C}}-\text{S}-$ in which R'' is defined above. Other specific examples of linkers useful herein are described below.

[00046] Figure 1 also provides specific examples of preferred tri-functional compounds described herein that have specific linkers present in the compounds.

[00047] In one aspect, the tri-functional compound comprises the formula V

wherein: R³ is hydrogen, a C₁-C₁₂ linear or branched alkyl group, a halogen, a C₆ to C₂₄ aryl group, a C₇ to C₂₄ aralkyl, or a C₁ to C₁₂ linear or branched alkoxy group; L¹ and L² are, independently, a linker as described above; X comprises a polymerization initiator as described above; and Y comprises an olefinic group as described above.

[00048] In one aspect, R³ in formula V is hydrogen. In another aspect, X in formula V comprises a monovalent radical of the formula VI

wherein: R¹ and R² are, independently, hydrogen, a C₁-C₁₂ linear or branched alkyl group, a C₆-C₂₄ aryl or substituted aryl group, a C₇-C₂₄ aralkyl group; and A is a hydroxyl group, a C₁-C₁₂ alkoxy group, a C₆-C₂₄ aryloxy group, or an amino group; and B is a silicon group, a carbonyl group, a dicarbonyl group, a C₁-C₁₂ linear or branched alkylene group, a C₁-C₁₂ linear or branched alkylene oxide group, a C₁-C₁₂ linear or branched alkylene amine group, or any combination thereof. In a further aspect, -L²-Y in formula V comprises the formula —(CH₂)_tUC(O)C(R⁴)=CH₂, wherein t is from 1 to 3, U is O or NH, and R⁴ is hydrogen or methyl.

[00049] Another preferred tri-functional compound has the formula VII

wherein R¹⁰ is hydrogen or methyl, L¹ and X are those described above. Preferably, L¹ can be derived from any protective labile group described herein including, for example, those

provided in Table 1 below., which can be combined with alkyl, aralkyl, aryl, alkoxy, aryloxy, or aralkyloxy groups. A preferred L^1 can have the formula

wherein: o, p, q, r, s, u, and v are, independently, an integer from 1 to 5; R^{11} and R^{12} are, independently, hydrogen or a C_1 - C_{12} linear or branched alkyl group. X preferably comprises the formula

[00050] In one aspect, the tri-functional compound comprises the formula VIII

wherein: R^3 is hydrogen, a C_1 - C_{12} linear or brached alkyl group, a halogen, a C_6 to C_{24} aryl group, a C_7 to C_{24} aralkyl, or a C_1 to C_{12} alkoxy group; L^1 and L^2 independently of each other is a linker described above; X comprises a polymerization initiator described above; Y comprises an olefinic group described above; and PG is a protective labile group.

[00051] In another aspect, the tri-functional compound comprises the formula IXa or b

wherein: R^5 is hydrogen, a C_1 - C_{12} linear or branched alkyl group, a C_1 - C_{12} linear or branched alkoxy group, or a C_6 - C_{24} aryl or substituted aryl group; L^1 and L^2 comprise, independently, a linker described above; X comprises a polymerization initiator described above; Y comprises an olefinic group described above; and PG comprises a protective group.

[00052] In one aspect, the tri-functional compound comprises the formula X

wherein: R^6 comprises hydrogen, a C_1 - C_{12} linear or branched alkyl group, a C_1 - C_{12} linear or branched alkoxy group, or a C_6 - C_{24} aryl or substituted aryl group; L^1 and L^2 comprise, independently, a linker described above; X comprises a polymerization initiator described above; Y comprises an olefinic group described above; and PG comprises a protective group described above.

[00053] Depending upon the structure of the tri-functional compounds, the compounds can be designed so that the UV absorber component essentially absorbs no energy at a particular wavelength. As will be discussed in greater detail below, by minimizing the amount of energy absorbed by the UV absorber component, shorter curing times can be achieved. This is due in part to the efficient activation of the initiator by the energy source without any interference (*i.e.*, competition) by the UV absorber component. Additionally, homogeneous curing can be achieved using the tri-functional compounds, which is another desirable feature in the manufacturing of ophthalmic lenses.

[00054] In certain aspects, the UV absorber component of the tri-functional compound can have one or more protecting groups that essentially prevent the absorption of energy by the UV absorber component. Thus, in this aspect, the protective group can render the UV absorber component essentially non-UV-absorbing. In general, the protective group is any group that can be readily cleaved using techniques known in the art. Examples of protecting groups include, but are not limited to, a silyl group or ester group. In one aspect, when a silyl group or carbonyl group is bonded to an aromatic oxygen, the silyl group or carbonyl group can be cleaved by varying the pH. A list of protecting groups and deprotection methods useful herein is provided in Table 1.

Table 1

Protecting Group	Deprotection methods
Methyl Ether	pH<1 and 100 °C; RS^+ , N_3^+ , SCN^+ and NaCN pH 12 nucleophilic reagents; $AlCl_3$ at 80 °C Lewis acids
Methoxymethyl Ether	pH 1; Zn/HCl 1 electron reductions; $AlCl_3$, $SnCl_4/BF_3$, and TsOH at 80 °C Lewis acids; HBr/ $In\cdot$ free radical reactions; heat >350 °C; C+/olefin electrophilic reagents
2-Methoxyethoxymethyl Ether	pH<1; $AlCl_3$ at 80 °C and TsOH at 80 °C Lewis acids; heat >350 °C
Methylthiomethyl Ether	pH<1; Zn/HCl and Zn/AcOH 1 electron reductions; $AlCl_3$ Lewis acids; Hg(II) soft acids, HBr/ $In\cdot$ free radical reactions; heat >350 °C
Phenacyl Ether	pH<1 and 100°C; pH>12 and 150 °C; Zn/HCl, Zn/AcOH, and Cr(II) at pH 5 1 electron reductions; $AlCl_3$ Lewis acids
Allyl Ether	pH<1 and 100°C; pH>12 and 150 °C; $AlCl_3$ Lewis acid; SeO_2 at pH 2-4 oxidations
Cyclohexyl Ether	pH<1
t-Butyl Ether	pH 1; Zn/HCl 1 electron reductions; $AlCl_3$, $SnCl_4/BF_3$, and TsOH at 80°C Lewis acids; heat >350°C; C+/olefin electrophilic reagents
Benzyl Ether	pH 1; H_2 /Raney (Ni), H_2 /Pt pH 2-4, H_2 /Rh and H_2 /Pd catalytic reductions; $AlCl_3$ at 80 °C Lewis acids
o-Nitrobenzyl Ether	pH<1 and 100 °C; H_2 /Raney (Ni), H_2 /Pt pH 2- 4, H_2 /Rh and H_2 /Pt catalytic reductions; $AlCl_3$ at 80 °C Lewis acids

9-Anthrylmethyl Ether	pH<1 and 100°C; RS^+ , N_3^+ , SCN^+ nucleophilic reagents; H_2 /Raney (Ni), H_2 /Pt pH 2-4, H_2 /Rh and H_2 /Pd catalytic reductions; $AlCl_3$ at 80°C Lewis acids
4-Picolyl Ether	pH<1 and 100 °C; H_2 /Raney (Ni), H_2 /Pt pH 2-4, H_2 /Rh and H_2 /Pd catalytic reductions; $AlCl_3$ Lewis acids
t-Butyldimethylsilyl Ether	pH from 2-4; pH>12 at 150 °C; H_2 /Pt pH 2-4 catalytic reductions; Zn/HCl 1 electron reductions; $AlCl_3$ at 80 °C and TsOH at 80 °C Lewis acids; HBr/In· free radical reactions
Aryl Acetate	pH 1; pH from 8.5 to 10; $CH_3S(O)CH_2^-Na^+$ and $NaNH_2$ bases; MeONa, enolate, NH_3/RNH_2 , and NaCN pH 12 nucleophiles; $LiAlH_4$, Li-s-Bu ₃ BH, i-Bu ₂ AlH hydride reductions; TsOH at 80 °C Lewis acids; H_2O_2 at pH 10-12 and NaOCl at pH 10 oxidations; and K_2CO_3 /MeI
Aryl Pivaloate	pH<1 and 100 °C; pH>12 at 150 °C; $LiAlH_4$ hydride reductions; heat >350 °C;
Aryl Benzoate	pH 1; pH>12; $CH_3S(O)CH_2^-Na^+$ and $NaNH_2$ bases; NaCN pH 12 nucleophiles; $LiAlH_4$ and i-Bu ₂ AlH hydride reductions; TsOH at 80 °C Lewis acids; H_2O_2 at pH 10-12 oxidations
Aryl 9-Fluorencarboxylate	pH<1 and 100 °C; pH>12; $NaNH_2$ bases; NaCN pH 12 nucleophiles; $LiAlH_4$, Li-s-Bu ₃ BH, and i-Bu ₂ AlH hydride reductions; $AlCl_3$ and TsOH at 80 °C Lewis acids

Aryl Methyl Carbonate	pH from 2-4; pH>12; $\text{CH}_3\text{S}(\text{O})\text{CH}_2^-\text{Na}^+$ and NaNH_2 bases; RS^+ , N_3^+ , SCN^+ and NaCN pH 12 nucleophilic reagents; RLi and RMgX organometallic reagents; H_2/Pt pH 2-4 catalytic reductions; Zn/HCl and Zn/AcOH 1 electron reductions; LiAlH_4 and $i\text{-Bu}_2\text{AlH}$ hydride reductions; AlCl_3 and TsOH at 80 °C Lewis acids; $\text{HBr}/\text{In}^\cdot$ free radical reactions; CrO_3 at pH 1; SeO_2 at pH 2-4 oxidations; heat >350 °C
Aryl 2,2,2-Trichloroethyl Carbonate	pH<1 and 100 °C; pH from 10-12; NaNH_2 bases; NaCN pH 12 nucleophiles; RLi and RMgX organometallic reagents; Zn/HCl , Zn/AcOH , and $\text{Cr}(\text{II})$ at pH 5 1 electron reductions; LiAlH_4 and $i\text{-Bu}_2\text{AlH}$ hydride reductions; AlCl_3 and TsOH at 80 °C Lewis acids; heat >350°C; $\text{K}_2\text{CO}_3/\text{MeI}$
Aryl Vinyl Carbonate	pH<1 and 100 °C; pH from 10-12; $\text{CH}_3\text{S}(\text{O})\text{CH}_2^-\text{Na}^+$ and NaNH_2 bases; and NaCN pH 12 nucleophilic reagents; RLi and RMgX organometallic reagents; Zn/HCl 1 electron reductions; LiAlH_4 and $i\text{-Bu}_2\text{AlH}$ hydride reductions; AlCl_3 and TsOH at 80 °C Lewis acids; $\text{Hg}(\text{II})$ soft acids; heat >350 °C; $\text{K}_2\text{CO}_3/\text{MeI}$
Aryl Benzyl Carbonate	pH<1; pH>12; $\text{CH}_3\text{S}(\text{O})\text{CH}_2^-\text{Na}^+$ and NaNH_2 bases; NaCN pH 12 nucleophilic reagents; RLi and RMgX organometallic reagents; $\text{H}_2/\text{Raney}(\text{Ni})$, H_2/Pt pH 2-4, and H_2/Pd catalytic reductions; LiAlH_4 and $i\text{-Bu}_2\text{AlH}$ hydride reductions; AlCl_3 and TsOH at 80 °C Lewis acids; heat >350 °C

Aryl Methansulfonate	pH>12; CH ₃ S(O)CH ₂ ⁻ Na ⁺ bases; RLi organometallic reagents; AlCl ₃ at 80 °C Lewis acids;
----------------------	---

[00055] Methods for deprotecting the compound when a protecting group is present include, for example, dipping the finished ophthalmic device in a highly basic solution. In one aspect, the device can be dipped in an aqueous solution having a pH greater than 10, greater than 11, or greater than 12 followed by drying. In other aspects, deprotection can be accomplished by exposing the device to heat. For example, the device can be placed in an autoclave and heated for a sufficient time and temperature to cleave the protecting group.

[00056] In other aspects, the initiator (and optional linker) can act as the protecting group. For example, with the tri-functional compounds having the formula V and VII, L¹-X is bonded to the aromatic oxygen of the UV absorber component of the tri-functional compound, which can render the UV absorber component essentially non-UV-absorbing.

[00057] The tri-functional compounds described herein can be synthesized using techniques known in the art. Exemplary reaction sequences for making the tri-functional compounds described herein are provided in Figures 2-8. Referring to Figure 2, the compound 20 can be reacted with a linker L¹ to produce compound 25. For example, the linker can be any compound that can react with an aromatic hydroxyl group. The compound having the formula 25 can then be subsequently reacted with initiator X to produce generic compound 30. Alternatively, a compound having the formula 20 can be reacted with a compound having the formula L¹-X, where the linker is covalently bonded to the initiator prior to reacting with a compound having the formula 20, and the linker has a functional group that can react with the aromatic hydroxyl group of the UV absorber component. Figure 3 provides a specific example of a reaction sequence. A compound having the formula 20 is first reacted with succinic anhydride (*i.e.*, the linker) to produce a compound having the formula 35. Next, the compound having the formula 35 is reacted with X-OH, where X is a residue of an initiator. For example, X-OH can be Irgacure[®] 2959, where the hydroxyl group pendant to the aromatic ring can react with the free carboxylic acid group of 35 to produce a compound having the formula 40. Another synthetic approach is depicted in Figure 4, where compound 20 is reacted first with a silyl compound (*e.g.*, SiMe₂Cl₂) followed by X-OH (*e.g.*, an initiator) to produce compounds having the formula 50. Compounds useful as starting

materials having the generic formula 20 are known in the art. For example, U.S. Patent Nos. 4,528,311; 4,716,234; 4,719,248; 3,159,646; and 3,761,272 discloses olefinic benzotriazoles. U.S. Patent No. 4,304,895 discloses polymerizable benzophenones (*i.e.*, possess olefinic groups). Figures 5-8 illustrate the reactions schemes and reaction conditions for preparing compound 15 of Figure 1, a compound similar to compound 15 of Figure 1 but slightly differing in the linker between the photoinitiator moiety and the UV-absorber moiety, a compound similar to compound 14 of Figure 1 but slightly differing in the linker between the photoinitiator moiety and the UV-absorber moiety, and compound 14 of Figure 1, respectively. A person skilled in the art will understand the schemes and know how to prepare those compounds of the invention according to the teachings shown in the schemes and the examples later.

[00058] In addition, compounds of the inventions can be prepared based on the well known reactions under the conditions that are customary for ester, thioester, amide, urethane or urea formation.

[00059] The compounds of the invention can be used in the production of UV-absorbing ophthalmic lenses. In one aspect, the invention provide a method for making UV-absorbing ophthalmic lenses. The method comprises the steps of:

- a. introducing into a mold a lens-forming material, wherein the lens-forming material comprises one or more tri-functional compounds described herein;
- b. curing the lens-forming material to produce the lens; and
- c. removing the lens from the mold.

[00060] A variety of different lens-forming materials can be used herein. The term “lens-forming material” is defined herein as any material that is capable of being polymerized using techniques known in the art. The lens-forming material can be a vinylic monomer, a prepolymer, a vinylic macromer, or any combination thereof. The tri-functional compounds described herein can be part of the lens-forming material as a vinylic monomer. For example, the lens-forming material can be composed of one or more tri-functional compounds in combination with other vinylic monomers, prepolymers, or macromers. In the alternative, the tri-functional compound can be polymerized with other monomers to produce prepolymers or macromers. The amount of tri-functional compound used in the lens-forming material can vary. In one aspect, the amount of tri-functional compound is selected such that the amount

of initiator is from 0.05 to 3%, 0.5 to 5%, 0.5 to 4%, 0.5 to 3%, 0.5 to 2%, 0.5 to 1.5%, or about 1% by weight of the lens-forming material.

[00061] In one aspect, the lens-forming material comprises a prepolymer. For example, a fluid prepolymer composition comprising at least one actinically-crosslinkable or thermally-crosslinkable prepolymer can be used. In one aspect, the fluid prepolymer composition is an aqueous solution comprising at least one actinically-crosslinkable prepolymer. It is understood that the prepolymer composition can also include one or more vinylic monomers, one or more vinylic macromers, and/or one or more crosslinking agents. However, the amount of those components should be low such that the final ocular device does not contain unacceptable levels of unpolymerized monomers, macromers and/or crosslinking agents. The presence of unacceptable levels of unpolymerized monomers, macromers and/or crosslinking agents will require extraction to remove them, which requires additional steps that are costly and inefficient.

[00062] Examples of actinically crosslinkable prepolymers include, but are not limited to, a water-soluble crosslinkable poly(vinyl alcohol) prepolymer described in U.S. Patent Nos. 5,583,163 and 6,303,687 (incorporated by reference in their entireties); a water-soluble vinyl group-terminated polyurethane prepolymer described in U.S. Patent Application Publication No. 2004/0082680 (herein incorporated by reference in its entirety); derivatives of a polyvinyl alcohol, polyethyleneimine or polyvinylamine, which are disclosed in U.S. Patent No. 5,849,841 (incorporated by reference in its entirety); a water-soluble crosslinkable polyurea prepolymer described in U.S. Patent No. 6,479,587 and in U.S. Published Application No. 2005/0113549 (herein incorporated by reference in their entireties); crosslinkable polyacrylamide; crosslinkable statistical copolymers of vinyl lactam, MMA and a comonomer, which are disclosed in EP 655,470 and U.S. Patent No. 5,712,356; crosslinkable copolymers of vinyl lactam, vinyl acetate and vinyl alcohol, which are disclosed in EP 712,867 and U.S. Patent No. 5,665,840; polyether-polyester copolymers with crosslinkable side chains which are disclosed in EP 932,635 and U.S. Patent No. 6,492,478; branched polyalkylene glycol-urethane prepolymers disclosed in EP 958,315 and U.S. Patent No. 6,165,408; polyalkylene glycol-tetra(meth)acrylate prepolymers disclosed in EP 961,941 and U.S. Patent No. 6,221,303; crosslinkable polyallylamine gluconolactone prepolymers disclosed in International Application No. WO 2000/31150 and U.S. Patent No. 6,472,489;

and silicone-containing prepolymers are those described in commonly-owned US Patent Nos. 6,039,913, 7,091,283, 7,268,189 and 7,238,750.

[00063] In another aspect, the lens-forming material is a polymerizable composition comprising at least one hydrophilic vinylic monomer. Any hydrophilic vinylic monomer described above can be used. The polymerizable composition can further comprise one or more hydrophobic vinylic monomers, crosslinking agents, radical initiators, and other components known to a person skilled in the art. These materials typically require extraction steps.

[00064] In another aspect, the lens-forming material is a silicone-containing prepolymer. Examples of such silicone-containing prepolymers include those described in commonly-owned US Patent Nos. 6,039,913, 7,091,283, 7,268,189 and 7,238,750, 7,521,519; commonly-owned US patent application publication Nos. US 2008-0015315 A1, US 2008-0143958 A1, US 2008-0143003 A1, US 2008-0234457 A1, US 2008-0231798 A1, and commonly-owned US patent application Nos. 61/180,449 and 61/180,453; all of which are incorporated herein by references in their entireties.

[00065] In another aspect, the lens-forming material is a polymerizable composition comprising at least one silicon-containing vinylic monomer or macromer, or can be any lens formulations for making soft contact lenses. Exemplary lens formulations include without limitation the formulations of lotrafilcon A, lotrafilcon B, conifilcon, balafilcon, galyfilcon, senofilcon A, and the like. A lens-forming material can further include other components, such as, a hydrophilic vinylic monomer, crosslinking agent, a hydrophobic vinylic monomer, a visibility tinting agent, photosensitizers, an antimicrobial agent, and the like.

[00066] In one aspect, the lens-forming material can be any silicone-containing vinylic monomers. Examples of preferred silicone-containing vinylic monomers include without limitation N-[tris(trimethylsiloxy)silylpropyl]-(meth)acrylamide, N-[tris(dimethylpropylsiloxy)-silylpropyl]-(meth)acrylamide, N-[tris(dimethylphenylsiloxy)silylpropyl] (meth)acrylamide, N-[tris(dimethylethylsiloxy)silylpropyl] (meth)acrylamide, N-(2-hydroxy-3-(3-(bis(trimethylsilyloxy)methylsilyl)propyloxy)propyl)-2-methyl acrylamide; N-(2-hydroxy-3-(3-(bis(trimethylsilyloxy)methylsilyl)propyloxy)propyl) acrylamide; N,N-bis[2-hydroxy-3-(3-(bis(trimethylsilyloxy)methylsilyl)propyloxy)propyl]-2-methyl acrylamide; N,N-bis[2-

hydroxy-3-(3-(bis(trimethylsilyloxy)methylsilyl)propyloxy)propyl] acrylamide; N-(2-hydroxy-3-(3-(tris(trimethylsilyloxy)silyl)propyloxy)propyl)-2-methyl acrylamide; N-(2-hydroxy-3-(3-(tris(trimethylsilyloxy)silyl)propyloxy)propyl)acrylamide; N,N-bis[2-hydroxy-3-(3-(tris(trimethylsilyloxy)silyl)propyloxy)propyl]-2-methyl acrylamide; N,N-bis[2-hydroxy-3-(3-(tris(trimethylsilyloxy)silyl)propyloxy)propyl]acrylamide; N-[2-hydroxy-3-(3-(t-butyl dimethylsilyl)propyloxy)propyl]-2-methyl acrylamide; N-[2-hydroxy-3-(3-(t-butyl dimethylsilyl)propyloxy)propyl]acrylamide; N,N-bis[2-hydroxy-3-(3-(t-butyl dimethylsilyl)propyloxy)propyl]-2-methyl acrylamide; N,N-bis[2-hydroxy-3-(3-(t-butyl dimethylsilyl)propyloxy)propyl]acrylamide; 3-methacryloxy propylpentamethyldisiloxane, tris(trimethylsilyloxy)silylpropyl methacrylate (TRIS), (3-methacryloxy-2-hydroxypropyloxy)propylbis(trimethylsiloxy)methylsilane, (3-methacryloxy-2-hydroxypropyloxy)propyltris(trimethylsiloxy)silane, 3-methacryloxy-2-(2-hydroxyethoxy)-propyloxy)propylbis(trimethylsiloxy)methylsilane, N-2-methacryloxyethyl-O-(methyl-bis-trimethylsiloxy-3-propyl)silyl carbamate, 3-(trimethylsilyl)propylvinyl carbonate, 3-(vinyl oxycarbonylthio)propyl-tris(trimethyl-siloxy)silane, 3-[tris(trimethylsiloxy)silyl]-propylvinyl carbamate, 3-[tris(trimethylsiloxy)silyl] propyl allyl carbamate, 3-[tris(trimethylsiloxy)silyl]propyl vinyl carbonate, t-butyl dimethyl-siloxyethyl vinyl carbonate; trimethylsilylethyl vinyl carbonate, and trimethylsilylmethyl vinyl carbonate). Most preferred siloxane-containing (meth)acrylamide monomers of formula (1) are N-[tris(trimethylsiloxy)silylpropyl]acrylamide, TRIS, N-[2-hydroxy-3-(3-(t-butyl dimethylsilyl)propyloxy)propyl]acrylamide.

[00067] In other aspects, siloxane-containing vinylic monomers or macromers with ethylenically unsaturated group(s) can be used to produce a silicone hydrogel material, which are useful as lens-forming materials. Examples of such siloxane-containing vinylic monomers and macromers include without limitation monomethacrylated or monoacrylated polydimethylsiloxanes of various molecular weight (e.g., mono-3-methacryloxypropyl terminated, mono-butyl terminated polydimethylsiloxane or mono-(3-methacryloxy-2-hydroxypropyloxy)propyl terminated, mono-butyl terminated polydimethylsiloxane); dimethacrylated or diacrylated polydimethylsiloxanes of various molecular weight; vinyl carbonate-terminated polydimethylsiloxanes; vinyl carbamate-terminated polydimethylsiloxane; vinyl terminated polydimethylsiloxanes of various molecular weight; methacrylamide-terminated polydimethylsiloxanes; acrylamide-terminated

polydimethylsiloxanes; acrylate-terminated polydimethylsiloxanes; methacrylate-terminated polydimethylsiloxanes; bis-3-methacryloxy-2-hydroxypropyloxypropyl polydimethylsiloxane; N,N,N',N'-tetrakis(3-methacryloxy-2-hydroxypropyl)-alpha,omega-bis-3-aminopropyl-polydimethylsiloxane; polysiloxanylalkyl (meth)acrylic monomers; siloxane-containing macromer selected from the group consisting of Macromer A, Macromer B, Macromer C, and Macromer D described in US 5,760,100 (herein incorporated by reference in its entirety); the reaction products of glycidyl methacrylate with amino-functional polydimethylsiloxanes; hydroxyl-functionalized siloxane-containing vinylic monomers or macromers; polysiloxane-containing macromers disclosed in U.S. Patent Nos. 4,136,250, 4,153,641, 4,182,822, 4,189,546, 4,343,927, 4,254,248, 4,355,147, 4,276,402, 4,327,203, 4,341,889, 4,486,577, 4,543,398, 4,605,712, 4,661,575, 4,684,538, 4,703,097, 4,833,218, 4,837,289, 4,954,586, 4,954,587, 5,010,141, 5,034,461, 5,070,170, 5,079,319, 5,039,761, 5,346,946, 5,358,995, 5,387,632, 5,416,132, 5,451,617, 5,486,579, 5,962,548, 5,981,675, 6,039,913, and 6,762,264 (here incorporated by reference in their entireties); polysiloxane-containing macromers disclosed in U.S. Patent Nos. 4,259,467, 4,260,725, and 4,261,875 (herein incorporated by reference in their entireties). Di and triblock macromers consisting of polydimethylsiloxane and polyalkyleneoxides could also be of utility. For example one might use methacrylate end capped polyethyleneoxide-block-polydimethylsiloxane-block-polyethyleneoxide to enhance oxygen permeability. Suitable monofunctional hydroxyl-functionalized siloxane-containing vinylic monomers/macromers and suitable multifunctional hydroxyl-functionalized siloxane-containing vinylic monomers/macromers are commercially available from Gelest, Inc, Morrisville, PA.

[00068] The lens-forming material, which includes one or more tri-functional compounds described herein is poured into a mold with a specific shape and size. When the ocular device is a contact lens, the lens can be produced using techniques known in the art. For example, the contact lens can be produced in a conventional "spin-casting mold," as described for example in U.S. Patent No. 3,408,429, or by the full cast-molding process in a static form, as described in U.S. Patent Nos. 4,347,198; 5,508,317; 5,583,463; 5,789,464; and 5,849,810.

[00069] Lens molds for making contact lenses are well known in the art. For example, a mold (for full cast molding) generally comprises at least two mold sections (or portions) or mold halves, i.e. first and second mold halves. The first mold half defines a first molding (or optical) surface and the second mold half defines a second molding (or optical) surface. The

first and second mold halves are configured to receive each other such that a lens forming cavity is formed between the first molding surface and the second molding surface. The molding surface of a mold half is the cavity-forming surface of the mold and in direct contact with the lens-forming material.

[00070] Methods of manufacturing mold sections for cast-molding a contact lens are generally well known to those of ordinary skill in the art. The first and second mold halves can be formed through various techniques, such as injection molding or lathing. Examples of suitable processes for forming the mold halves are disclosed in U.S. Patent Nos. 4,444,711; 4,460,534; 5,843,346; and 5,894,002, which are also incorporated herein by reference.

[00071] Virtually all materials known in the art for making molds can be used to make molds for preparing ocular lenses. For example, polymeric materials, such as polyethylene, polypropylene, polystyrene, PMMA, cyclic olefin copolymers (e.g., Topas[®] COC from Ticona GmbH of Frankfurt, Germany and Summit, New Jersey; Zeonex[®] and Zeonor[®] from Zeon Chemicals LP, Louisville, KY), or the like can be used. Other materials that allow UV light transmission could be used, such as quartz glass and sapphire.

[00072] Once the lens-forming material is poured into the mold, the lens-forming material is cured (*i.e.*, polymerized) to produce a polymeric matrix and ultimately the lens. The techniques for conducting the polymerization step will vary depending upon the selection of the lens-forming material. In one aspect, when the lens-forming material comprises a prepolymer comprising one or more actinically-crosslinkable ethylenically unsaturated groups, the mold containing the admixture can be exposed to a spatial limitation of actinic radiation to polymerize the prepolymer. In other aspects, the mold containing the lens forming material can be subjected to heat in order to cure the lens-forming material.

[00073] In other aspects, the energy used to cure the lens-forming material is in the form of rays directed by, for example, a mask or screen or combinations thereof, to impinge, in a spatially restricted manner, onto an area having a well defined peripheral boundary. For example, a spatial limitation of UV radiation can be achieved by using a mask or screen that has a transparent or open region (unmasked region) surrounded by a UV impermeable region (masked region), as schematically illustrated in Figs 1-9 of U.S. Patent No. 6,627,124 (herein incorporated by reference in its entirety). The unmasked region has a well defined peripheral boundary with the unmasked region. The energy used for the crosslinking is radiation energy,

UV radiation, visible light, gamma radiation, electron radiation or thermal radiation, the radiation energy preferably being in the form of a substantially parallel beam in order on the one hand to achieve good restriction and on the other hand efficient use of the energy.

[00074] In one aspect, the mold containing the lens-forming material is exposed to light having a wavelength greater than 340 nm, greater than 350 nm, greater than 360 nm, greater than 370 nm, or greater than 380 nm. Cut-off filters known in the art can be used to filter and prevent specific wavelengths of energy from contacting the mold and lens-forming material. The time the lens-forming mixture is exposed to the energy is relatively short, e.g. in less than or equal to 150 minutes, in less than or equal to 90 minutes, in less than or equal 60 minutes, less than or equal to 20 minutes, less than or equal to 10 minutes, less than or equal to 5 minutes, from 1 to 60 seconds, or from 1 to 30 seconds.

[00075] After polymerization of the lens-forming material and formation of the lens, the initiator and, if present, the linker are optionally cleaved from the tri-functional compound. In certain aspects, the removal of the initiator and optional linker “deprotects” the UV absorber component of the tri-functional compound. In other aspects, when the UV absorber component is protected with other groups (*e.g.*, formulae VIII-X), the protecting groups can be readily cleaved. The conditions for deprotecting the UV absorber component can vary depending upon the selection of these components. By varying conditions such as temperature and pH, the initiator or other protecting groups can be cleaved to produce the active UV absorber component. The conditions described above for deprotection can be used herein to cleave the initiator and linker.

[00076] The invention further provides a UV-absorbing ophthalmic lenses incorporating therein a UV-absorbing compound of the invention.

[00077] The following examples are put forth so as to provide those of ordinary skill in the art with a complete disclosure and description of how the compounds, compositions, and methods described and claimed herein are made and evaluated, and are intended to be purely exemplary and are not intended to limit the scope of what the inventors regard as their invention. Efforts have been made to ensure accuracy with respect to numbers (*e.g.*, amounts, temperature, etc.) but some errors and deviations should be accounted for. Unless indicated otherwise, parts are parts by weight, temperature is in °C or is at ambient temperature, and pressure is at or near atmospheric. There are numerous variations and combinations of

reaction conditions, e.g., component concentrations, desired solvents, solvent mixtures, temperatures, pressures and other reaction ranges and conditions that can be used to optimize the product purity and yield obtained from the described process. Only reasonable and routine experimentation will be required to optimize such process conditions.

DCC: N, N-Dicyclohexyl carbodiimide; **HMPA:** Hexamethylphosphoramide; **THF:**

tetrahydrofuran; **AIBN:** 2-2-Azoiso bisbutyronitrile; **NBS:** N-Bromosuccinimide

Example 1

[00079] This example illustrates the preparation of a tri-functional UV-absorber of the invention, UVA 1, based on the following scheme.

Step-1:

Step-2:

[00080] A mixture of 500 mg (2.22 mmol) 1, 245 mg (2.45 mmol) succinic anhydride, 247 mg (2.47 mmol) TEA and 10 ml toluene is refluxed for 5 hours under nitrogen atmosphere. The reaction mixture is cooled to ambient temperature, solvent is evaporated under reduced pressure, and the residue is dissolved in 10 ml of ethyl acetate and washed with 5ml of 1N HCl. Organic layer is dried over Na_2SO_4 . The solvent is removed under reduced

pressure and the obtained intermediate **2**, is dried under vacuum at 30° C. The results of ¹H-NMR (400MHz, DMSO-D₆) δ are: 1.35 (s, 6H), 2.47-2.54 (m, 4H), 4.27-4.26 (d, *J*= 4 Hz, 2H), 4.370-4.358 (d, *J*=4.8 Hz, 2H), 5.68 (bs, 1H, OH), 7.03-7.01(d, *J*=8.8 Hz, 2H), 8.22-8.19(d, *J*=8.8 Hz, 2H), 12.24(bs, 1H, COOH). The mass is determined to be 325 (M+H) by mass spectroscopy. Two peaks are observed at 212 nm and 266 nm in UV-visible absorption spectra.

[00081] A solution of 7.47g (36.2 mmol) of DCC in 15ml of DCM is added to a stirred mixture of 4.7g (14.4 mmol) of **2**, 4.21g (13.04 mmol) of **3**, 20 mg (0.090 mmol) of D-MAP And 35ml of DCM at 0° C under nitrogen atmosphere. Reaction mixture is stirred at 0° C for 3 h, 20ml of water is added and the mixture is extracted with DCM, the organic layer is washed with 20 ml of 1N HCl followed by brine. Organic layer is dried over Na₂SO₄, the solvent evaporated under reduced pressure, and the crude final compound, UVA **1**, is purified by column chromatography on Silica (100-200 mesh) in 50% n-Hexane in ethyl acetate. The results of ¹H-NMR (400MHz, CDCl₃) δ are: 1.66(s, 6H), 1.93(s, 3H), 2.77-2.80(t, d=6.8 Hz, 2H), 2.95-2.99(t, *J*= 6.8 Hz, 2H), 3.08-3.12(t, *J*=6.8 Hz, 2H), 4.21-4.23(m, 2H), 4.42-4.48 (m, 4H), 5.55-5.56 (t, *J*=1.6 Hz, 1H), 6.1(s, 1H), 6.91-6.94 (dd, *J*=2.8Hz, 2H), 7.23-7.25(d, *J*=8.4 Hz, 1H), 7.34-7.37 (dd, *J*=2 Hz, 1H), 7.39-7.43(m, 2H), 7.87-7.93(m, 2H), 8.03-8.07(m, 3H) MS: 630(M+H), 652(M+Na). Four peaks are observed at 212 nm, 272 nm, 302 nm and 590 nm in UV/Visible absorption spectra.

Example 2

[00082] This example illustrates the synthesis of a tri-functional UV-absorber of the invention, UVA **2** according to a scheme shown below:

Step 1

Step 2

[00083] NaH 60% (0.246g, 6mmol) is added to a stirred solution of compound-1(1g, 3mmol) and 2 ml of HMPA in 20 ml of Dry THF at 0 ° C under nitrogen atmosphere. After 10 min, the solution of dimethyl malonyl chloride (3mmol, freshly prepared from dimethyl malonic acid and oxalyl chloride) dissolved in dry-THF is added drop wise into the reaction mixture at 0 ° C. the reaction mixture is stirred at 0 ° C for 1h, then the reaction mixture is

quenched with 1N HCl (20ml) and extracted with DCM, dried over Na₂SO₄ and concentrated under reduced pressure to obtain crude intermediate (**2**).

[00084] Above crude (**2**) is dissolved in THF (20ml) and treated with 0.2M (10ml) of aqueous solution of LiOH and stirred overnight at ambient temperature. THF is evaporated under reduced pressure, and the resulting residue of crude intermediate (**3**) is diluted with water and acidified with 1N HCl (PH=3) and extracted with DCM, dried over Na₂SO₄, and concentrated under reduced pressure. Crude intermediate (**3**) thus obtained is purified by column chromatography 100-200 silica, eluted with 5% MeOH in DCM. ¹H-NMR (400MHz, CDCl₃) δ: 1.59(s, 6H), 1.92(s, 3H), 3.09-3.12(t, 2H, J=6.4), 4.41-4.44(t, 2H, J=6.4), 5.54-5.55(t, 1H, J=1.6), 7.24-8(7H, Ar-H). MS: 438(M+H), 460(M+Na).

[00085] A solution of 0.589g (2.8 mmol) of DCC in 3 ml of dichloro methane is added to a stirred mixture of 0.5g (1.14 mmol) of **3**, 0.256g (1.14 mmol) of **4**, catalytic amount of DMAP, and 5ml of dichloro methane at 0°C under nitrogen atmosphere. Reaction mixture is stirred at 0°C for 3 h, 5 ml of water is added and the mixture is extracted with dichloro methane, the organic layer is washed with 5 ml of 1N HCl followed by brine. Organic layer is next dried over Na₂SO₄, the solvent is evaporated under reduced pressure, and the resultant crude (**5**), UVA **2**, is purified by column chromatography on silica (100-200 mesh) in 50% n-hexane in ethyl acetate. ¹H-NMR (400MHz, CDCl₃) δ: 1.54 (s, 6H), 1.63(s, 6H), 1.92(s,

3H), 3.04-3.08(t, J=6.8 Hz, 2H), 4.20-4.23(m, 3H), 4.37-4.4 (t, J=6.8 Hz, 2H), 4.50-4.52 (t, J = 4.8 Hz, 2H), 5.54-5.55 (t, J=1.6 Hz, 1H), 6.09 (s, 1H), 6.87-6.91(m, 2H), 7.16-7.21 (m, 2H), 7.39-7.44 (m, 2H), 7.87-7.91(m, 2H), 7.99(s, 1H), 8.04-8.08 (m, 2H). MS: M+H (644), M+Na (666). Three peaks are observed at 218nm, 266nm and 302nm in UV Visible absorption spectra.

Example 3

[00086] This example illustrates the synthesis of a tri-functional UV-absorber of the invention, UVA 3 according to a scheme shown below:

[00087] Starting fluoro compound (p-fluoro acetophenone derivative 1) is prepared according to the procedures described in U.S. patent No. US 5,554,663 (herein incorporated by reference in its entirety).

[00088] Intermediate-2 is prepared as follows. p-Fluoro acetophenone derivative 1 (5g, 0.017 mol), piperazine (2.0g, 0.033 mol) and potassium carbonate (6.9g, 0.05mol) are dissolved in 50 ml dry DMF and reflux for 24h under nitrogen atmosphere. After complete consumption of starting material (the progress of the reaction is monitored by TLC), the reaction is cooled to room temperature and after the solvent (DMF) is evaporated, the residue

is dissolved in dichloromethane and washed with water (3 X 20 mL). The organic layer is washed with brine and dried over anhydrous sodium sulphate. The crude product obtained after evaporation is purified by column chromatography using 5% methanol in dichloromethane (100-200 mesh silica gel).

[00089] Intermediate 2 (5g, 0.01369 mol) and succinic anhydride (1.37g, 0.0137) dissolved in acetonitrile (50ml) is stirred at room temperature for 1hr., then the solvent is evaporated under vacuum to yield compound 3 as yellow residue. It is used for the next step without further purification.

[00090] DCC (6.2g, 0.05mol) in DCM (20ml) is added to the stirred mixture of compound 3 (5.6g, 0.012mol), Benzotriazole derivative (4.28g, 0.013mol) and catalytic amount of D-MAP in DCM (40ml) at 0°C under nitrogen. Mixture is stirred at 0°C for 6 hrs. 50 ml of water is added and the mixture is extracted with dichloro methane, the organic layer is washed with 30 ml of 1N HCl followed by brine. The organic layer is dried over Na₂SO₄, the solvent is evaporated under reduced pressure, and the crude target compound 4, UVA 3, is purified by column chromatography on Silica (100-200 mesh) followed by elution with 30% n-hexane in ethyl acetate. **¹H-NMR (400MHz, CDCl₃)** δ 0.58-0.62 (t, J = 7.6 Hz, 3H), 1.17-1.18 (m, 2H), 1.73-1.80 (m, 2H), 1.85 (s, 4H), 2.28 (s, 6H), 2.65-2.68 (t, J = 6.8 Hz, 2H), 2.93-2.97 (t, J = 7.2 Hz, 2H), 3.01-3.15 (m, 4H), 3.24 (s, 4H), 3.52-3.54 (t, J = 4.8 Hz, 2H), 3.7 (t, J = 4.8 Hz, 2H), 4.35 (t, J = 6.8 Hz, 2H), 5.48 (s, 1H), 6.03 (s, 1H), 6.72 (d, J = 9.2 Hz, 2H), 7.09 – 7.11 (m, 4H), 7.22-7.24 (d, J = 8.4 Hz, 1H), 7.30-7.33 (dd, J = 2 Hz, 1H), 7.35-7.38 (m, 2H), 7.84-7.88 (m, 2H), 8.27-8.30 (d, J = 8.8 Hz, 2H). MS: M+H (771.8). Three peaks are observed at 216 nm, 284nm and 302 nm in UV visible spectra

Example 4

[00091] This example illustrates the synthesis of a tri-functional UV-absorber of the invention, UVA 4 according to a scheme shown below:

Step 1**Step 2**

[00092] **Preparation of Compound-3:** NaH 60% (0.246g, 6mmol) is added to a stirred solution of compound-1(1g, 3mmol) and 2 ml of HMPA in 20 ml of Dry THF added at 0 ° C under nitrogen atmosphere. After 10 min, the solution of dimethyl malonyl chloride (3mmol, freshly prepared from dimethyl malonic acid and oxalyl chloride) dissolved in dry-THF is added dropwise into the reaction mixture at 0 ° C. The reaction mixture is stirred at 0 ° C for 1h, then the reaction mixture is quenched with 1N HCl (20ml) and extracted with DCM, dried over Na_2SO_4 and concentrated under reduced pressure to obtain crude product (2).

[00093] Above crude compound (2) is dissolved in THF (20ml) and treated with 0.2M aqueous solution of LiOH over night at ambient temperature. THF is evaporated under reduced pressure, then the crude residue is diluted with water and acidified with 1N HCl (PH=3) and extracted with DCM, dried over Na_2SO_4 , concentrated under reduced pressure, and the resulting crude intermediate (3) is purified by column chromatography using 100-200 silica, 5% MeOH in DCM as eluting agent. **1H -NMR (400MHz, $CDCl_3$) δ :** 1.59(s, 6H),

1.92(s, 3H), 3.09-3.12(t, 2H, J=6.4), 4.41-4.44 (t, 2H, J=6.4), 5.54-5.55(t, 1H, J=1.6), 7.24-8(7H, Ar-H). MS: 438(M+H), 460(M+Na).

[00094] A solution of 5.7g (0.00277mol) of DCC in 20 ml of dichloro methane is added to a stirred mixture of 4.8g (0.01108 mol) of **3**, 2.83g (0.0077mol) of **4**, catalytic amount of D-MAP and 40ml of dichloro methane at 0° C under nitrogen atmosphere. Reaction mixture is stirred at 0° C for 6 h, 50 ml of water is added and the mixture is extracted with dichloro methane, the organic layer is washed with 30 ml of 1N HCl followed by brine. Organic layer is dried over Na₂SO₄, the solvent is evaporated under reduced pressure, the crude target compound, DP-UVA 4, is purified by column chromatography on silica (100-200 mesh) in 50% n-Hexane in ethyl acetate. **¹H-NMR (400MHz, CDCl₃)** δ: 0.63-0.67 (t, J = 7.2 Hz, 3H), 1.57 (s, 8H), 2.00 (s, 3H), 2.33 (s, 3H), 3.07-3.20 (m, 8H), 3.45-3.46 (m, 4H), 4.39-4.42 (t, J = 6.8 Hz, 2H), 5.53 (m, 1H), 6.07 (s, 1H), 6.67-6.70 (d, J = 9.2 Hz, 2H), 7.12-7.22 (m, 8H), 7.38-7.46 (m, 2H), 7.88-7.91 (m, 2H), 8.30-8.33 (d, J = 9.2 Hz, 2H). MS: M+H (785.5), M+Na (807.4). Five peaks are observed at 302 nm, 350nm, 482 nm, 530 nm and 560 nm in UV visible spectra

Example 5

[00095] This example illustrates the synthesis of a tri-functional UV-absorber of the invention, UVA 5 according to a scheme shown below:

Step: 1

Step: 2

Step: 3

Step: 4

Step:5

[00096] A mixture of 5g (14.3mmol) of compound 1, 3.55g (20.09 mmol) of N-Bromosuccinimide, 0.05g of AIBN and 30 ml of tetrachloromethane is refluxed for 5h under Nitrogen atmosphere. The reaction mixture is filtered after cooling. The filtrate evaporated and dried to obtain compound-2 (8.4g crude), crude TLC shows closure multiple spots. Without further purification the material is taken for next step.

[00097] A mixture of 19.8 mmol of compound 2, 3.64g (21.8 mmol) of silver acetate and 85 ml of glacial acetic acid is refluxed for 3h. The mixture is filtered and 500 ml of water is added to the filtrate and mixture is extracted with 150 ml of DCM (3 times). Combined organic layer is washed with 100 ml of water (3 times), dried over Na₂SO₄ and the solvent is removed under reduced pressure. Crude product is purified by column chromatography (25% EtOAc in Hexane). The compound-3 is obtained after solvent evaporation. ¹H-NMR

(400MHz, CDCl₃) δ : 2.05(s, 6H), 2.35(s, 3H), 5.1(s 2H), 6.99(s, 2H), 7.49-7.60 (m, 6H), 7.97-8.02(m, 4H). MS: 407(M+H), 429(M+Na).

[00098] A mixture of 2g (4.922 mmol) of compound 3.28, 12 ml THF, 2.81 ml HCl, 14.06 ml of water (0.2:2:1) is refluxed for over night. THF is removed under reduced pressure and 10 ml water is added and the mixture is extracted with 15 ml of DCM (3 times), combined organic layer are washed with 15 ml of water (3 times), the organic layer is dried over Na₂SO₄, and the solvent is evaporated. The crude product is purified by column chromatography (2% MeOH in DCM). After drying, compound 4 is obtained. ¹H-NMR: (400MHz, CDCl₃) δ : 2.05(s, 6H), 2.74 (bs, 1H, OH), 4.59 (s 2H), 6.99 (s, 2H), 7.49-7.60 (m, 6H), 7.97-8.02(m, 4H). MS: 365(M+H), 387(M+Na).

[00099] A mixture of 4g (10.977 mmol) 4, 1.20g (12.0747 mmol) succinic anhydride 5, 1.22g (12.0474 mmol), triethyl amine and 40 ml of dry toluene is refluxed for 5 h under nitrogen atmosphere and then cooled to ambient temperature. The solvent is evaporated under reduced pressure, the residue is dissolved in 50 ml of ethyl acetate and washed with 20ml of 1N HCl. Organic layer is dried over Na₂SO₄. The solvent is removed under reduced pressure and the obtained product 6 is dried under vacuum at 30° C. ¹H-NMR: (400MHz, CDCl₃) δ : 2.05 (s, 6H), 2.58-2.56 (t, J = 5.6 Hz, 4H), 5.08 (s 2H), 6.99 (s, 2H), 7.49-7.60 (m, 6H), 7.97-8.02 (m, 4H). MS: 465(M+H), 487(M+Na).

[000100] A solution of 5.44g (26.37 mmol) of DCC in 50ml of dichloro methane is added to a stirred mixture of 4.9g (10.55 mmol) of 6, 3.411g (10.55 mmol) of 7, 50 mg (0.225 mmol) of D-MAP and 50ml of Dichloro methane at 0° C under nitrogen atmosphere. Reaction mixture is stirred at 0° C for 3 hours. 20ml of water is added and the mixture is extracted with dichloro methane. The organic layer is washed with 20 ml of 1N HCl followed by brine. The organic layer is dried over Na₂SO₄, the solvent is evaporated under reduced pressure and the crude compound is purified by column chromatography on Silica (100-200 mesh) in 2% acetone in DCM. ¹H-NMR (400MHz, CDCl₃) δ : 1.73 (s, 3H), 1.89 (s, 6H), 2.69-2.72(t, J=7.2 Hz, 2H), 2.85-2.89(t, J=6.0 Hz, 2H), 3.07-3.10 (t, J=6.4 Hz, 2H), 4.35-4.38 (t, J=6.4 Hz, 2H), 5.01(s, 1H), 5.99(s, 1H), 7.00(s, 1H), 7.28-7.30(d, J=8.4 Hz, 1H), 7.48-7.50 (m, 3H), 7.51-7.62 (m, 4H), 7.63-7.70 (m, 2H), 7.86-7.99(m, 4H), 8.03-8.07(m, 2H), 8.08(s, 1H). MS: 770(M+H). Three peaks are observed at 218 nm, 296 nm and 380 respectively in UV/Visible absorption spectra.

[000101] Throughout this application, various publications are referenced. The disclosures of these publications in their entireties are hereby incorporated by reference into this application in order to more fully describe the compounds, compositions and methods described herein.

[000102] Various modifications and variations can be made to the compounds, compositions and methods described herein. Other aspects of the compounds, compositions and methods described herein will be apparent from consideration of the specification and practice of the compounds, compositions and methods disclosed herein. It is intended that the specification and examples be considered as exemplary.

What is claimed:

1. A compound comprising an ultraviolet absorber, a polymerization initiator directly or indirectly bonded to the ultraviolet absorber, and an ethylenically unsaturated group directly or indirectly bonded to the ultraviolet absorber.
2. The compound of claim 1, wherein the compound comprises the formula I

wherein

Z is a divalent radical of formula (1a), (1b), (1c) or (1d)

in which R^{3a} , R^{3b} , R^{3c} , R^{2z} , R^{3z} , R^{4z} , and R^{1z} , independent of another, are hydrogen, halogen, a C_1 - C_{12} linear or branched alkyl group, a C_1 - C_{12} linear or branched alkoxy group, or a C_6 - C_{24} aryl or substituted aryl group, PG is a protective labile group;

X is a monovalent radical comprising a polymerization initiator moiety selected

from the group consisting of phosphine oxide ($\begin{array}{c} \text{O} \quad \text{O} \\ \parallel \quad \parallel \\ -\text{C}-\text{P}- \\ | \end{array}$), a peroxide group, an azide group, an α -hydroxyketone, or an α -aminoketone;

Y is a monovalent radical of formula (2)

in which Z_1 and Z_2 independent of each other are a covalent bond, a linear or branched C_1 - C_{12} alkylene divalent radical, a linear or branched C_1 - C_{12} alkylene divalent radical having one or more hydroxyl groups, a radical of $-(CH_2CH_2O)_d-CH_2CH_2-$ in which d is an integer of 1 to 10, unsubstituted phenylene divalent radical, C_1 - C_4 alkyl or C_1 - C_4 alkoxy substituted phenylene divalent radical, C_7 - C_{12} aralkylene divalent radical, $-O-$ or $-\overset{\text{R}'}{\underset{|}{N}}-$ in which R' is H or C_1 - C_8 alkyl; A_5 is a covalent bond, $-O-$ or $-\overset{\text{R}'}{\underset{|}{N}}-$ in which R' is H or C_1 - C_8 alkyl; q_1 and q_2 independent of each other are an integer of 0 or 1; R_{14} is hydrogen, C_1 - C_4 alkyl or halogen; R_{15} and R_{16} independent of each other are hydrogen, C_1 - C_4 alkyl, phenyl, carboxy, halogen, or a radical of $-\overset{\text{O}}{\parallel}{C}-X_3-R_{17}$ in which X_3 is $-O-$, $-\overset{\text{R}'}{\underset{|}{N}}-$ as defined above or $-S-$ and R_{17} is C_1 - C_{12} alkyl, C_1 - C_{12} hydroxyalkyl, C_1 - C_{12} aminoalkyl, alkylaminoalkyl having up to 12 carbon atoms, or dialkylaminoalkyl having up to 12 carbon atoms; and

L^1 and L^2 independently of each other are a covalent bond or a linker.

3. The compound of claim 1 or 2, wherein the polymerization initiator comprises a phosphine oxide, a peroxide group, or an azide group.
4. The compound of claim 1 or 2, wherein the polymerization initiator moiety comprises a monovalent radical of formula IIa, IIb or XI

wherein R is oxygen, nitrogen, a linear or branched C_1 - C_{12} alkylene divalent radical,

a divalent radical of $-\text{OCH}_2\text{CH}_2\text{O}-$, a divalent radical of $-\text{alk}-\overset{\text{R}''}{\underset{|}{N}}-$ in which R'' is hydrogen or a C_1 - C_{12} alkyl radical and alk is C_1 - C_{12} alkylene divalent radical, or

combinations thereof, R^1 and R^2 are, independently, hydrogen, a C_1 - C_{12} linear or branched alkyl group, a C_6 - C_{24} aryl or substituted aryl group, a C_7 - C_{24} aralkyl group; and

A comprises a hydroxyl group, a C_1 - C_{12} alkoxy group, a C_6 - C_{24} aryloxy group, or a primary, secondary or tertiary amino group,

wherein t_1 and t_2 independent of each other are 0 or 1 provided that at least one of t_1 and t_2 is 1, one of Q^{1a} and Q^{1b} is a covalent bond and the other is hydrogen, C_1 - C_6 linear or branched alkyl group, or C_1 - C_6 linear or branched alkoxy group, Q^{2a} , Q^{2b} , Q^{3a} , Q^{3b} independently of one another hydrogen are C_1 - C_{12} linear or branched alkyl group, or C_1 - C_{12} linear or branched alkoxy group.

5. The compound of claim 1 or 2, wherein the polymerization initiator moiety comprises a monovalent radical of formula III or IVa or b

in which Ph is phenyl group and Me is methyl group.

6. The compound of claim 1 or 2, wherein the polymerization initiator moiety comprises a monovalent radical of formula XII

wherein V is a covalent bond or oxygen, and R is a C_1 - C_{20} linear or branched alkyl group or phenyl.

7. The compound according to any one of claims 1 to 6, wherein L^1 and L^2 independent of each other are a covalent bond or a linker of a silicon group, a carbonyl group, a dicarbonyl group, an alkylene group, an alkylene oxide group, an alkylene amine group, or any combination thereof.
8. The compound according to any one of claims 1 to 6, wherein L^1 and L^2 independent of each other are a covalent bond or a divalent radical of

in which:

X_a is a covalent bond, carbonyl ($-\overset{\text{O}}{\parallel}{\text{C}}-$), $-\overset{\text{R}^e}{\underset{\text{R}^f}{\text{Si}}}-$ in which R^e and R^f independently of each other are a C_1 - C_8 -alkyl, phenyl or a C_1 - C_4 alkyl- or C_1 - C_4 -alkoxy-substituted phenyl, a divalent radical of $-(R^aO)_n-$ in which R^a is a linear or branched C_1 - C_{12} -alkylene and n is from 1 to 10, $-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, or $-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$ in which R'' is H or C_1 - C_8 alkyl;

E_1 and E_2 independently of each other are a covalent bond, a divalent radical of $-(R^aO)_n-$ in which R^a and n are defined above, $-\text{N} \begin{array}{c} \diagup \quad \diagdown \\ \diagdown \quad \diagup \end{array} \text{N}-$, $-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, or

$-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$ in which R'' is H or C_1 - C_8 alkyl, a C_1 to C_{12} linear or branched alkylene divalent radical, a cycloalkyl diradical with up to 40 carbon atoms, an alkylcycloalkyl diradical with up to 40 carbon atoms, an alkylaryl diradical with up to 40 carbon atoms, an arylalkylene divalent radical with up to 40 carbon atoms, or a dicarbonyl group having the formula $-\text{C}(\text{O})\text{L}^3\text{C}(\text{O})-$ in which L^3 is a C_1 to C_{12} linear or branched alkylene divalent radical or $-(R^{e1}-O)_{w1}-(R^{e2}-O)_{w2}-(R^{e3}-O)_{w3}-$, wherein R^{e1} , R^{e2} , and R^{e3} independently of one another are a linear or branched C_1 - C_4 -alkylene and w_1 , w_2 and w_3 independently of one another are a number from 0 to 20 provided that the sum of $(n+m+p)$ is 1 to 60; and

X_b and X_c independently of each other are a covalent bond, $-\overset{\text{O}}{\parallel}{\text{C}}-$, $-\text{O}-$, $-\overset{\text{R}''}{\text{N}}-$, $-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$, $-\overset{\text{R}''}{\text{N}}-\overset{\text{O}}{\parallel}{\text{C}}-$, $-\overset{\text{R}''}{\text{N}}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}-$, $-\text{HN}-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{R}''}{\text{N}}-$, $-\text{O}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}-$, $-\text{HN}-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, $-\text{S}-\overset{\text{O}}{\parallel}{\text{C}}-\text{NH}-$, $-\text{O}-\overset{\text{O}}{\parallel}{\text{C}}-$, $-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-$, $-\text{S}-$, and $-\text{HN}-\overset{\text{O}}{\parallel}{\text{C}}-\text{S}-$ in which R'' is defined above.

9. The compound of claim 8, wherein the compound is defined by the formula V

wherein R³ is hydrogen, halogen, a C₁-C₁₂ linear or branched alkyl group, a C₁-C₁₂ linear or branched alkoxy group, or a C₆-C₂₄ aryl or substituted aryl group.

10. The compound of claim 9, wherein X is a monovalent radical of the formula VI

wherein: R¹ and R² are, independently, hydrogen, a C₁-C₁₂ linear or branched alkyl group, a C₆-C₂₄ aryl or substituted aryl group, a C₇-C₂₄ aralkyl group;

A is a hydroxyl group, a C₁-C₁₂ alkoxy group, a C₆-C₂₄ aryloxy group, or an amino group; and

B is a silicon group, a carbonyl group, a dicarbonyl group, a C₁-C₁₂ linear or branched alkylene group, a C₁-C₁₂ linear or branched alkylene oxide group, a C₁-C₁₂ linear or branched alkylene amine group, or any combination thereof.

11. The compound of claim 8 or 9, wherein the compound has the formula VII

wherein R¹⁰ is hydrogen or methyl.

12. The compound of claim 11, wherein L¹ is a divalent radical of the formula

wherein o, p, q, r, s, u, and v are, independently, an integer from 1 to 5; and

R¹¹ and R¹² independently of each other are hydrogen or a C₁-C₁₂ linear or branched alkyl group.

13. The compound of claim 8 or 9, wherein the compound comprises the formula VIII

wherein R³ is hydrogen, halogen, a C₁-C₁₂ linear or branched alkyl group, a C₁-C₁₂ linear or branched alkoxy group, or a C₆-C₂₄ aryl or substituted aryl group.

14. The compound of claim 8 or 9, wherein the compound has the formula IXa or b

wherein R⁵ is hydrogen, a C₁-C₁₂ linear or branched alkyl group, a C₁-C₁₂ linear or branched alkoxy group, or a C₆-C₂₄ aryl or substituted aryl group.

15. The compound of claim 8 or 9, wherein the compound has the formula X

wherein R⁶ comprises hydrogen, a C₁-C₁₂ linear or branched alkyl group, a C₁-C₁₂ linear or branched alkoxy group, or a C₆-C₂₄ aryl or substituted aryl group.

16. An ophthalmic lens comprising a polymer which is the copolymerization product of one or more compounds of any one of claims 1-15 with one or more vinylic monomers and/or macromers.

17. An ophthalmic lens obtainable by a process comprising the steps of:
 - a. introducing into a mold a lens-forming material, wherein the lens-forming material comprises one or more compounds in any of claims 1-15;
 - b. curing the lens-forming mixture to produce the lens; and
 - c. removing the lens from the mold.
