

ABSTRACT

The present disclosure provides an information indicating method and apparatus, a user equipment (UE), a base station, and a storage medium, and belongs to the technical field of communications. The method comprises: a UE acquiring indication information sent by a base station (101), the indication information comprising at least one TCI state ID corresponding to at least one codepoint; the UE then determining that a TCI state corresponding to the at least one TCI state ID is a joint TCI state and/or a separate TCI state, and/or determining that the TCI state is applicable to uplink transmission and/or downlink reception (102). Thus, in the embodiments of the present disclosure, unified TCI state indication is implemented, reducing signaling overhead and improving DCI signaling reliability.
