(54) Title: MULTI-BLOCKCHAIN DIGITAL TRANSACTION INFORMATION SEGREGATION SYSTEM

FIGURE 4

(57) Abstract: The systems and methods of the multi-blockchain transaction information segregation system of the present disclosure receive a first digital transaction, which includes first digital transaction information and second digital transaction information, through a network via broadcast by a first transaction device. A primary blockchain address provided on a primary blockchain is then identified in the first digital transaction, and a primary blockchain smart contract that is stored on the primary blockchain in association with the primary blockchain address is accessed. The primary blockchain smart contract is then executed to cause the first digital transaction information to be stored on the primary blockchain, and the second digital transaction information to be stored on a secondary blockchain that is separate from the primary blockchain. In a specific example, the first digital transaction information identifies a physical property, and the second digital transaction information identifies a purchase price of the physical property.
