

**Method of Fact Checking Contents in Non-Digital Documents
Against Trade Finance Criteria**

ABSTRACT

Disclosed is a computer-implemented method of fact checking contents in a non-digital document against one or more predefined rules, comprising providing, by an input module of a processing server, a set of documents in an at least partially non-searchable format; digitizing, by a digitization module of the processing server, the documents to produce fully searchable, digitized documents; using an extraction module of the processing server to determine one or more data objects for extraction, extract the one or more data objects from the digitized document, and predict the context of the one or more data objects extracted, based on content of the one or more data objects; and detecting, by a verification module of the processing server, whether the one or more data objects meet the one or more predefined rules.
