ABSTRACT**Disk Drive and Actuator**

G00002

A disk drive has an actuator (30) supported for turning, and supporting magnetic heads (32) for reading and writing data from and to a recording disk (12) and a voice coil (33) for driving the actuator (30). Plates (36) are disposed near the voice coil (33) so as to cover part of the voice coil (33). The disk drive is capable of preventing an increase in seek time and reducing data processing time.
