(54) Title: RADIO DEVICE FOR A WIRELESS NETWORK

(57) Abstract: A radio device for a wireless network comprising: an outer protective casing (3) housing an electronic transceiver circuit (4); and four radiating elements (5) carried by the protective casing and having orientations that differ from one another. The outer protective casing (3) is configured in such a way that, when it is set on a plane surface, it sets itself with just one radiating element (5) substantially perpendicular to the plane surface; the radio device is able to determine autonomously the orientation assumed and comprises an automatic selector (20) for selecting the radiating element (5) set substantially perpendicular to the plane surface.
