

ABSTRACT

TRAVELING VEHICLE SYSTEM

[Problem] To provide a traveling vehicle system capable of suppressing vibrations to a traveling vehicle.

[Means to Solve Problem] A traveling vehicle system may include a track and a traveling vehicle. The track may include a plurality of first tracks, a plurality of second tracks, and a partial track which is provided at a portion where first and second extension lines intersect. The traveling vehicle may include a traveler which travels on an upper side of the track, a main body which is positioned below the track, and a coupler which couples the traveler and the main body. A gap through which the coupler passes when the traveling vehicle travels may be formed between the first track and the partial track, and between the second track and the partial track. The traveler may include four wheels which travel on the track, and a direction changer which changes a traveling direction of the traveling vehicle between a first direction and a second direction by turning the four wheels respectively around four turning axes which are orthogonal to respective axles of the wheels. In a plan view, none of sides of a quadrilateral formed with the four turning axes serving as vertices thereof is parallel to the first track or the second track.
