

ABSTRACT

[Problem] Reduction in operational rates of a device that performs processing on performed articles.

[Solution to problem] A transport vehicle system 1 includes a plurality of transport vehicles 5 and a controller 10 that allocates a transport instruction to the plurality of transport vehicles. The controller 10 allocates a first transport instruction when the first transport instruction having first priority occurs in a state in which number of vacant transport vehicles is a first number and does not allocate a second transport instruction to vacant transport vehicles when the second transport instruction having second priority lower than the first priority occurs in a state in which number of vacant transport vehicles is the first number.
