

ABSTRACT

The present disclosure relates to a channel state information reporting method and apparatus, and a storage medium. The channel state information reporting method is applied to a terminal and comprises: measuring channel state information on the basis of at least one channel measurement resource (CMR), the channel state information comprising a measurement result obtained by measurement on the basis of the at least one CMR, and the measurement result comprising a precoding matrix indicator (PMI) shared by the at least one CMR; and reporting the channel state information. According to the present disclosure, a joint PMI feedback method based on at least one CMR is realized, the signaling overhead is reduced, and the transmission performance based on multiple CMRs is improved.
