

ABSTRACT

MANAGEMENT SYSTEM FOR CASINO ITEMS

The management system (30) is a management system for a gaming chip (72) equipped with an RFID tag (721), wherein the RFID tag (721) stores identification information including a tag ID assigned at the time of manufacture of the RFID tag (721) and a chip ID assigned at the time of manufacture of the gaming chip (72). The management system (30) comprises: an antenna (361a) and a chip tray reader/writer (362a) that read identification information from the RFID tag (721) of the gaming chips (72) that exist within a reading range; a table verification device (363) that controls the chip tray reader/writer (362a). The table verification device (363) causes the chip tray reader/writer (362a) to repeatedly perform a first reading, in which the chip ID is read without reading the tag ID, and, when a new chip ID was read in the first reading, causes the chip tray reader/writer (362a) to perform a second reading in which the tag ID is read.
