

Variable Angle Partition Holder

Abstract

A variable partition holder for a shower screen having a swing door. The holder
5 comprises a shaft which retains the door, an angle adjustor piece and a housing.
The shaft and the angle adjustor piece are adapted to engage each other
rotatably. The angle adjustor piece and the housing are adapted to engage each
other at a relative angle such that when they are engaged, the door is positioned
at an angle (between about 0° and 135°) with respect to the housing. The
10 relative angle at which the angle adjustor piece and the housing engage each
other can be altered, thereby altering the angle at which the door is positioned
with respect to the housing.
