ABSTRACT

A shape of reinforcing bars is suitably detected. A binding system (1) for performing binding by using a binding device based on signal information on a plurality of arranged reinforcing bars, includes a second camera (51) that acquires image data of the reinforcing bars (S), and a control unit (77). The control unit (77) detects a shape of the reinforcing bars (S) based on contrast information included in the image data of the reinforcing bars (S).
