

ABSTRACT**METHOD FOR PUSHING AN OBJECT AND PUSH DEVICE**

A method for pushing an object includes steps of:
a) providing first and second slide seats that are able
5 to be driven by at least one driving force to move relative
to each other along a first straight line; b) providing
a push member that is movable along a second straight
line for pushing the object; and c) associating the push
member with the first and second slide seats such that
10 the push member and any one of the first and second slide
seats are moved relative to each other along the second
straight line by the relative movement between the first
and second slide seats.
