

Catheter device for placing a sensor

Abstract

5 A catheter device (1) for placing a sensor device (2) comprises a shaft (10) and a coupling device (3), arranged at the shaft (10), for coupling the catheter device (1) to the sensor device (2) comprising at least one bracket element (21). The coupling device (3) comprises a coupling element (30) and a locking element (31) adjustable with respect to the coupling element (30), wherein the coupling element (30) comprises at least one engagement section
10 (302) with which the at least one bracket element (21) of the sensor device (2) can be brought in engagement, wherein the locking element (31) is designed, in a coupled position, to block the at least one bracket element (21) at the at least one engagement section (302), and is adjustable with respect to the coupling element (30) so as to release the at least one bracket element (21) for detachment from the at least one engagement section (302).
