

Abstract

5

In order to produce a slab track for rail vehicles with an
emergency pathway (12) for road vehicles, a prefabricated
track section with rails (8) and sleepers (5) is supported
and positioned on a substructure (1) by means of a
10 supporting and aligning device (4). Subsequently, a track
slab (10) is produced by casting in the sleepers (5). The
part of the sleepers (5) that projects from the track slab
(10) and the rails (8) are separated by formwork elements,
and an emergency pathway (12) is applied to the track slab
15 (10) by casting.
