

ABSTRACT

162162

The invention relates to a method of manufacturing sheets based on hydraulic binder, particularly sheets of plasterboard with feathered edges.

This method comprises the steps of:

- 1) making a mark (301) on a facing (2 or 3) of the preform (5);
- 2) detecting the mark (301); and
- 3) sending an actuating signal to a device (9) for cutting the preform (5).

The invention also relate to a production line for producing such sheets, and to an apparatus, particularly for making an impression (12, 12bis) in a preform (5).

This apparatus comprises:

- a frame (101);
- first (102, 103) and second (105, 106) pulleys;
- two belts (108, 109) wrapped around the pulleys (102, 103, 105, 106);
- at least one wire (111) extending between these belts (108, 109) so that its axis is parallel to the axis of the pulleys (102, 103, 105, 106).
