

PAYMENT METHODS AND APPARATUSES, ELECTRONIC DEVICES, AND READABLE MEDIA

ABSTRACT

Embodiments of this specification disclose payment methods and apparatuses,
5 electronic devices, and readable media. The payment method includes the following: A
payment instruction sent by a first user by scanning an order QR code is received, where
the order QR code is generated based on a first order corresponding to a target product,
and the first order is generated based on a purchase operation performed by a second
user for the target product; the first order is set to an occupied state, where a payment
10 instruction of a user other than the first user is rejected to be executed when the first
order is in the occupied state; a second order of the first user is created based on an
order identifier of the first order in the occupied state; and a payment operation is
performed based on the second order.
