

ABSTRACT

5 **Container Structure For Removal of Vacuum Pressure**

10 A hot-fill plastic container (10) has a wall (9) extending to a lower portion including a pressure panel (11) and a base (2). The panel (11) is transversely oriented and has an initiator portion (1) and control portion (5) enabling the inversion of the panel (11) into the container (1) to compensate for pressure change.
