According to one embodiment, system controls
electrical apparatus installed in target area. This
system includes image sensor and server. Image sensor
5 senses target area, acquires, from sensed image of
area, human information representing state of person in
area and environmental information concerning
environment of area for each of divided areas obtained
by dividing area, and outputs human information and
10 environmental information. Server is connected to
image sensor via communication network and executes
task-ambient control for electrical apparatus based on
human information and environmental information for
each of areas output from image sensor.
