

## ABSTRACT

A massager (1) performs kneading massage, stretching, etc. on user's hand held in a sandwiched state therein.

The massager (1) comprises: an insertion recess (3) to receive a first treatment target area (P) and a second treatment target area (F) continuous with the first treatment target area (P); a first massage unit (4) to massage the first treatment target area (P) received in a sandwiched state in the insertion recess (3); a second massage unit (5) to massage the second treatment target area (F) received in a sandwiched state in the insertion recess (3); and a driver (6) to drive the first massage unit (4) and the second massage unit (5). The first massage unit (4) is located frontward, and the second massage unit (5) is located rearward. The first massage unit (4) and the second massage unit (5) move toward and away from each other in a front-rear direction.
